Creating the solution would be pretty easy. Showing just enough numbers to solve it but not giving away too many might be more difficult.

For those that don't know, Sudoku is a 9X9 grid, where each column, row, and 3X3 square contains one of each number 1-9. It would be easy to randomly fill the grid, but then you have to reveal enough numbers for someone to solve it.

3174. [annc] DIS6502 1.6 released

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-17 03:28:55 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns96B4E45B0923Femuslor@216.196.97.136>
Source record: 10331

My apologies if this appears twice. The first attempt does not appear to have made it through...

Version 1.6 of Eric Bacher's interactive 6502 disassembler has been released. This release is a port to Win32 with a few bug fixes and a number of new features. You can now find the latest version at its new home:

http://sourceforge.net/projects/dis6502/

We hope those of you who remember DIS6502 from back in the 16-bit Windows days will grab this new one and give it a run. Make sure you take a look at changes.txt for release notes, and please enter any bug reports or feature requests in the project tracker on SourceForge.

Thanks!

3176. Sinistar for Atari 8-bit!

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-17 07:50:08 UTC
From: bill@newbreedsoftware.com
Message-ID: <Q_BMe.9547$p%3.37768@typhoon.sonic.net>
Source record: 10333
Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari

AtariAge.com reports:

Atari 8-bit Sinistar Prototype Discovered!
http://www.atariage.com/index.html#5135

"Fans of classic arcade games are all too familiar with the roar, 'Beware I Live!' A long, lost prototype of the beloved (and difficult) arcade game Sinistar has been uncovered for Atari 8-bit computers. Thanks to the hard work of Atari Archivist Ken Van Mersbergen, this unreleased arcade to home conversion has finally been found. Sinistar combines fast action, mind numbing speed, and evil sounding voice synthesis into one explosive package. Your goal is to destroy Sinistar, a giant metal creature bent on destroying the universe and whatever else that gets in its way. However, to destroy Sinistar you must make Sinibombs out of Sinisite crystals harvested from floating plantetiods.

"The Atari 8-bit version is a wonderful port, capturing all the action and excitement of the arcade game. The graphics are amazingly accurate, the controls are sharp and precise, and the digitized voice rings out loud and clear. Sinistar was just about finished, but there are a few minor issues and bugs that needed to be addressed before the game saw a commercial release. The biggest issue is the computer AI, which isn't quite polished. Sinistar will be displayed in public at this weekend's Dallas vgXpo show, and plans are to release the Sinistar binary in the near future so everyone can enjoy it. You can read a thorough review of Sinistar over at AtariProtos.com, and discuss this exciting find in our Prototypes Forum."

You can learn about it, and see lots of pretty screenshots, here:

http://www.atariprotos.com/8bit/software/sinistar/sinistar.htm

"So why wasn't Sinistar released? Around the time Sinistar was being completed (mid 1984), the video game market was crumbling fast and many games were canceled. Apparently marketing decided that the game wasn't going to make enough money and canceled. the project? without telling the programmers! Jeff and his team continued to work on the project for almost two months after it was canceled. due to lack of communication between marketing and the programming department. Incidents like this were not uncommon, and just goes to show how badly out of touch the managers were at the time of Atari's collapse."

I cannot WAIT until that's released! Ooooooooooooh yeah!

Actually, that's easier than making the solution that gets hidden.
Many puzzles I've seen seem to have a symettric pattern, mirrored around
a diagonal going from the lower left to the upper right. [*]

Just pick ~15 positions between (0,0) and (8-y,y) (for y = 0..9, where
(0,0) is top left and (8,8) is bottom right).

Expose those positions, as well as the mirrors of those positions.

[*] for example:

```
... ... ..X
XX. ... X..
... X.. ...
```

```
... ... ..X
X.. X.X ..X
X.. ... ...
```

```
... ..X ...
..X ... .XX
X.. ... ...
```

I'm far from an expert, though... A coworker showed me the game recently,
and since then I've been noticing it many other places, so have picked up
a very few things. Only actually played a game once. (I'm have pretty
bad attention skills :^))

Hi,

> If the power doubler diodes have failed would the power light still
> illuminate or does it take it's juice from after the power doubler?

No, it takes the 5V pass from the power supply, not the 12V pass via
the voltage doubler circuit. Thus, power is lid regardless of the
doubler circuit diodes. You'll find them in the middle rear part
of the drive, right between three large capacitors.

So long,
Thomas

Thanks, that's what I remembered controlling it but my joystick, while moving the bins from side to side, was not controlling the gauge. The keyboard did work (E and C keys to change speed and D to freeze the gauge at the desired position).

I mapped the joystick to emulate the keyboard and it is working now.

Thanks for your help.

This is quite cool! I didn't look at the page much (just played with it for a few minutes on my PAL 800XL last night), but couldn't tell how or if I could do two-humans vs one-computer mode. Also, [Space] seemed to pause, but then I was stuck.

OTOH, everything else about this game is awesome. Great animation, great digitized sound, very pretty background. I remember playing the original IK on my friend's Amiga.

Filling the grid is easy. It's the clue numbers that cause problems.
They need to lead to a unique solution. A UK newspaper recently stuffed
up big-time, expecting to have to pick a correct answer to their
single solution puzzle. Turns out they'd got the clues wrong. There were
over 170 possible solutions. So, instead of getting a few hundred correct
answers, they got thousands.

Hi,

Bob Klaas was the person to take over the SUPRA interface. I'm not
sure if he sells them anymore, but he would have the disk you require.

I know he also burned the ROMS depending on what drive was installed.
I think they were for disk parameters.

I may have a disk lying around if you cant find one or cant contact
Bob.

I just went to http://www.websudoku.com/ and reloaded a couple of puzzles.
I feel like a loser that I never noticed the symmetry in the pattern of
exposed numbers! That should make it even easier. I guess I need to start
work on it then, I don't have any excuse now!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

And subsequently, rights to all K-Products products were obtained by Video 61.

So even though I don't see the disk listed at www.atarisales.com I'd suggest
giving Lance a call.

I only had a link to some terrible scans plus I forgot about your
request. Sorry for the delay.

Here is a source of high quality schematics, drawings not scans. In the
file 400.ZIP you will find diagrams for the original 400 8K and 16K
memory modules. The memory modules are the same for the 800, BTW.

Wow - I've bought from them several times and never had a problem. Always
got what I ordered. BTW, VSWMORETP is "Software and More". They used to
operate at http://members.aol.com/SWMoreTP/HOME.html but moved to eBay.

That wouldn't be the bell and howell box that he was selling on ebay would it? The description was quite clear to me, B & H BOX. I wouldn't expect a computer inside.

3197. LJK Letter Perfect

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-19 03:04:56 UTC
From: Michael Current <hunmanik@earthlink.net>
Message-ID: <3diag1h4ovpgd0puspoktk01uhgl28boao@4ax.com>
Source record: 10254

Remember Letter Perfect from LJK?

I've acquired a couple original copies of Letter Perfect in recent years, thinking they would be good to have around as backup copies since this was my word processor way back in high school. I still remember this being such a rock-solid piece of software (in comparison to, say, AtariWriter 80, my word processor in college).

Anyway, I just noticed that there are version numbers on the backs of the disks. One set says V6.02 while the other set says V6.05.

I know there were many earlier versions before 6, as well as cartridge releases, but I don't remember ever being aware of different versions of the disk-based version 6.

Anyone familiar with different revisions of Letter Perfect 6? What was improved or fixed? Anyone know what the last version was?

-Michael

FamilyNet International Newsgate

I also was the same way. :) I will be picking ths game up.

I have often thought that when I pass on and someone looks at my Atari computer, they will see stuff that will fit from the 70's and 80's. And then there will be interfaces and game cartridges from the early 00's (which I call the naughties) and they will say to theirself "What the hell!"

Glad stuff is still being made for my computer. :)

3203. DGS Atari 8-bit CD-ROM $7 Special (until 26 Aug 2005)

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-19 18:00:43 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1124474446.29780.0@echo.uk.clara.net>
Source record: 10259

Hello All,

This week (until 26 August 2005) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $7 (2.50pounds for UK buyers), which is a $3 saving on the usual price. This price includes Airmail shipping to any country (first class post for UK buyers).

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

Please be aware that this isn't some sort of trick or con, and I'm not intending to run off with your money! Despite the fact that I've been trading for 17 years, people still don't seem to know who I am. There's plenty of background info on DGS on the main part of the website, and there's also a link to an independent review of the CD.

Hey! Never thought of that!

No idea if there was/is or will-be a 5200 version. Probably not outside
the realm of possibility, once the XL version is released.
(How's licensing being dealt with with that, anyway!? 8^o)

The voltages at the test points 5v 12v 22v, are all correct as per the SAMS manual. So the fault is not with the diodes, nor it is the pwer supply.

Any ideas ?

thanks

Also check it with another disk as sometimes the sleeves get a little
warped and drag.

There is VR2<?> that adjusts the speed. Sometimes people adjust these
out of specs so they can write a bad sector.

3211. Atari USB Update -- Support for USB Floppy Drives

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-21 20:12:24 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2005.08.21.20.12.24.657798@strotmann.de>
Source record: 10268

Hello,

the USB Team, Thomas, Florian, Carsten (Harry was unavailable), worked this weekend (friday to sunday) in Carstens basment to create new USB Hard- and Software for the 8bit Atari.

We have new Pictures online at:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBConvFourPic

What is new:

* a new Hex2Bin Converter (internal Tool)
* a new Version of the USBTEST Tool
* Support for USB (UFI) Floppies (DOS Driver hopefully available in End-September)

More news can be found in the upcoming ABBUC Magazin (look for Hardware Contest)

The new USBTOOL Version 0.5 will be available on Wednesday, 08/24/05, on the SourceForge Project Pages (microusb.sf.net).

If you have access to an USB Floppy, an UFI/USB ZIP-Drive or any other Device compatible with the UFI/CBI Standard, please test with the new USBTEST and give us feedback.

Greetings

the MicroUSB Team

I'd vote for Speedscript. I modified it so it would exit to DOS on
RESET, if I remember the original would just re-run itself.
I'm gonna send it to you, you can see if you like it.

Source record: 10275

I sold my 130xe a couple years ago and I have regretted it. I recently bought a 65xe on ebay (won the auction today) I paid 5 dollars plus 15 shipping. that is 20 bucks total, is that about right?

Also are there any easy mods to bring this up to 128k or higher? I plan on making or buying a SIO2PC cable and using an old laptop as a slave with every 8bit game ever made on it (I have every game ever made for the 8bit on one full CDR which I will copy to the laptops hard drive) will the SIO2PC software work with Windows XP as well as the older versions?

thanks !!!

Kevin

I like Ken Siders KEDIT. I use it for my Forth Sourcecode (USB Project).
Works very good with SpartaDOS, BeweDos and RealDOS. The only thing I'm
missing is an open source editor (or the source for KEDIT), so that I can
tweak the editor to jump directly to Forth and start compiling :)

KEDIT can also be put into an AtariMax Flash Cart and can be started "from
ROM" from the SpartaDOS Command Line.

From the KEDIT Webpage:
"Text Editor designed to accompany
KASM65. Features 40/80 columns on screen. Horizonal scrolling ACTION! type
editor. Keyboard macro capability. Version 1.51. Version 1.53 will be here
soon (24699 bytes)"

Just an opinion but if you get an SIO2PC cable you will probably want to rethink expanding the memory. I/O is fast enough that even many older games that were a pain to play with all the disk access, like Ultima III, run quite well.

Not really. Many items are worth more with the box intact. In some
cases, even double the value.

Cheers,
Mike T.

3222. ATASCII viewer for DOS/Win?

There are plenty of options for converting ascii docs to atascii and vice versa. Along the way, has anyone written a simple atascii file viewer for the DOS or Windows? Or, in my Xanadu, a simple viewer that can detect either format and display it properly for viewing?

thanks

> cases, even double the value.

The box, it's value - it's all perception based. Most collectors of these kinds of items are somewhat obsessive-compulsive. They want to complete a collection, they seek to have something the other collectors do not. The reason anything has value is because someone out there wants it or it would be worthless otherwise. I don't mean that like it's a bad thing, merely that it's a reality.

Besides - that box looked like it was in pretty rough shape.

From a collecting standpoint - MHO is that an item like the B&H box is only worth something if it matched up to the computer that came with it (BH with original packing container), or if it had some historical or special value. Maybe... "B&H Apple II box, originally hand-packaged by Woz himself - has small blood stain from where Woz accidentally nicked himself with the packing tape dispenser. Proof of DNA on file, will provide Certificate of Authenticity. Clone your own personal Woz."

Ick!

SIO2PC does not work very well with XP, SIO2PC being a DOS application which needs direct control of the serial port.

There's Windows APE, which works great but is not free. 30 day trial then you need to register.

There is also Atari810 for Windows NT/2000/XP, I think. Don't use XP so I don't use it.

AtariSIO is great but it's for Linux. There's also a floppy/CD bootable version. Can access FAT and FAT32 partitions. Don't know about NTFS. The author, Matthias Reichl, hangs out at this NG so he can answer any questions.

I use AtariSIO a lot. I have a nice bootable CD which uses a script to load random games, one CD for ATRs and one for binaries. Don't even need a hard disk. This was a nice way to use some of my ancient hardware.

Sometime I'll get around to loading the full Linux version of AtariSIO (but then I'll have to try to learn Linux again, yuck!).

All the Atari disk emulator programs work with a standard SIO2PC cable except AtariSIO does not work with the original 2-chip SIO2PC, Max232 design cable. Works great with a 1-chip MAX233 (easier to build than MAX232) which I chose to build when I wanted to use AtariSIO.

You would need more than 64K to use Mydos and configure it for the 800.

I assume you are refering to using the ram above 48K for a ramdisk in a 64K 800(400 too I think).

You get about 100 free sectors.

You have the right power supply.

You are using a TV, so pressing ctrl + 2 does not buzz?

Holding START and turning on the XL does not produce a buzz?

Then its the cpu, pia, ram, or OS rom most likely.

Do you mean it isn't running at 300 rpm? Is slow to load/save? (That speed it typically about 800 bytes a sec).

Slight correction here, 810/815/1050 drives run at 288 rpm, not 300.
Running them 12 rpm faster can cause read/write problems.

I saw a friend take a 65XE and over years watch that poor thing just fall apart. It was really funny to see happen. How the keyboard fell apart to the point my friend had to jump points on the keyboard to short the right key to start his games.
Star Raiders was a real pain to play at that point. :D

Sadly, my opinion of the 130, 65 and XEGS wer formed from those experiences.

Doc Clu... who prefers an Atari 800, and recently warmed up to the 800 xl.

(only took me nearly 20 years to warm up the xl.. but hey!)

> next ?
>
> thanks

If the keyboard is okay, I would try looking at the 4051 multiplexers
between the keyboard and the POKEY chip. These help scan the 8 x 8 matrix.

Space and M are on the same row

K5,K4,K3 = 1,0,0

but on two different columns

K2,K1,K0 = 0,0,1 for space
K2,K1,K0 = 1,0,1 for M

so that suggests the K2 connection is faulty at least.

These keys are sensed by input KR1.

Control, shift and break are read by input KR2, and this goes directly from
the keyboard to another pin of the POKEY chip. That suggests POKEY is
reasonably alive and well.

Can you at least tell us what is happening on pins 9, 10, 11 of the 4051
chips?
They should be toggling rapidly.
Check pin 16 is a healthy 5V.

Hi,
This could also be a SIO2PC interface with the older style 25 pin connector
and electronics built into hood. Also could be and Xformer cable. Other
multiple possibilities. Check under the HOOD and tell us what is there.
(i.e.) resistors, 14 pin chip with numbers on it, diodes, etc...

On Wed, 24 Aug 2005 at 09:53 -0400, Mike Morgan scribbled:
->One of the cables is a mystery to me. It's an SIO->DB25(male).
->Does anyone know what this cable is used for?

Since P:R:s tend to be sensitive, I don't want to move or even touch mine unless I have to. So I'm relying on the manual for a reminder of the technical details. It says that the two serial ports are nine pins while the parallel port is 15 pins. If your mystery cable has a true Atari SIO end on it then that would be 13 pins. In that case it isn't a regular daisy-chain cable and it isn't a P:R: cable. It sounds like an extra cable that somebody got hold of which should be treated as a separate item.

It could be called a crazy cable. That's what dealers at ham-fests and computer shows call them. Despite the name, it's a ser-ious and potentially useful item. If somebody has a need for a 13-to-25 cable, *and the pins are connected the way they're needed* for that particular situation, then this cable would avoid having to build one. (Been-there-done-that! But it's a lot easier to buy one -- if you can!)

This cable could also connect between the Atari 8-bit and some 25-pin device. But it would end the daisy chain unless other Atari SIO ports were available. If you really want to identify an Atari application for it, perhaps it's mentioned in the FAQ file, or per-haps people at Best Electronics or B&C could identify it.

RoyE,

The only electronics is a resistor between 2 pins on the DB25 side.
I didn't count to see what pins but I imagine it's probably Vcc or
ground to terminal ready pin. The only other thing of note is that it
looks like a quality job (no globs of solder, wires all perfectly cut,
etc.), suggesting that it may have been produced in bulk. Tonight I may
take it apart again and do a pin->pin map.

thanks,
Mike

This cable is most probably the Xformer cable. Check the following link.

http://www.emulators.com/xformer.htm#CABLE

If it looks like this then the mystery is solved.

Not likely to be a SIO2PC cable which uses female DB-9/DB-25 connectors
to mate with the PC serial port which is always has a male connector.

The cable in question has a male DB-25 connector.

Thanks much!

Have some 800XL questions but I should start new topics for these.

Stephen Sheppard

3255. 800XL question

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-25 19:08:55 UTC
From: stephensheppard@hotmail.com
Message-ID: <1124996935.300886.41350@g47g2000cwa.googlegroups.com>
Source record: 10162

The easy one first. I've been given and 800XL. It seems to be near new condition but the left shift key binds. Seems like it needs lubricating but before I try to pop the key I want to make sure this isn't a No-No. Suggestions?

Compared to my now 26 yr-old 800 the 800XL had terrible video quality so I started looking at Ben Poehland's Super Video XL 2.0/2.1/2.1a mod (see link at end). First thing I did was clip capacitor C56. Right there the bluriness was gone. Since the only video cable I had on hand was the DIN-5 to SVideo cable that I use for my 800 I was only getting a Black and White picture. This is because the 800XL doesn't normally have Composite Chrominance available. So that was the next thing I planned to change. Now mod 2.0 suggests installing a Composite Video enable/disable switch. This cleans up graininess and vertical lines when SVideo/chroma+luma is used. Since I don't ever plan on using Composite Video I just clipped resistor R56 instead of putting the SPST switch in series. To save myself a trip to Radio Shack I reused the resistor as the "pick-off" resistor for chroma connection. Now here some questions regarding this video mod.

The instructions call for a 100 Ohm resistor for the pick-off resistor but the one I re-used is 75 Ohm. How much difference will this make? What is a "pick-off" resistor anyway?

The video looks darn good now. The blurriness is gone. Text is incredibly sharp. Contrast and color saturation are at least 25% better than my 800 (which produces washed out colors, IMO). Not much noise (RF?) with either machine but the 800XL is ever so slightly worse than the 800.

I do have one problem. At high contrast transitions there is an artifact that resembles ghosting or shadowing. On text it shows up as a shadow or even a different color on the leading edge of each text character. It's actually not very noticable on text but stick out like sore thumb at the left margin of the BASIC screen, where the blue Window is next to the black border. The shadow is green or grey. (I'll try to provide a picture in a followup message).

Here the question(s). Could this problem have anything to do with my using a 75 ohm pick-off resistor instead of 100 ohms? If not, would it be corrected if I complete the rest of the 2.0/2.1 mod or at least more of the mod? Could my poorly assembled video cable (made by me LOL) be the cause, though the issue does not show up on my 800 using the same cable.

Now to change the subject (with more questions). Short of buying an EPROM programmer (which I have no intention of doing) what are the options for DIY OS ROM mods?

Has anyone actually installed the Dallas SmartSocket plus SDRAM? What success, problems, issues?

Is it possible to use EEPROMs in place of EPROMs? If so which type/size? Come to think of it, what size/type EPROM is used for the 800XL?

What OS's are a good choice for the 800XL to play with. Is licensing an issue? Keep in mind this is exclusively for my own machine and for my own use. I just want to experiment.

Try it and see.

Easy way to do this is to hold a 300R resistor in parallel with the 100R.

> I do have one problem. At high contrast transitions there is an
> artefact that resembles ghosting or shadowing.

Sounds like the signal is 'echoing' in the cable.

The point of having 75R output impedance is that it ensures maximum signal
transfer from source to cable, and from cable to input. At the input end it
minimises reflected energy.

> Could this problem have anything to do with my
> using a 75 ohm pick-off resistor instead of 100 ohms?

Sounds probable.

A bigger power rail decoupler may help. See:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

> Is it possible to use EEPROMs in place of EPROMs? If so which
> type/size?

> what size/type EPROM is used for the 800XL?

16K for the OS and 8K for the BASIC.

Perhaps you could frig them both into a 32K EEPROM.

Of course you will have to do some work yourself, checking pinouts and
wiring in a write signal if you plan to have it reprogrammable in-site.

K.

3260. Need some info regarding 65xe (NTSC)

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-26 00:10:57 UTC
From: kevin <kevnospam242@gmail.com>
Message-ID: <5dnsg1tgm9r8ffock9p2dvinl5cjn532de@4ax.com>
Source record: 10167

I recently purchased a 65xe and much to my suprise it has the same expansion port in the back as the 130xe. Everything I've read states the 65xe does not include this port (at least not the NTSC model) so does anyone know what I have? Im thinking maybe some of the early ones or later ones in NA did include the port?

Kevin

>

Designing circuits are probably beyond my ability and understanding.

I might find the resources on hand to be able to write EEPROMs using
other hardware, possibly. Of course, I would like to learn whether
EEPROMs will work or not, as-is, in the place of the Atari OS ROMs.

I'm seriously thinking about the Dallas SmartSocket but I sure would
like to talk to someone who has already tried that mod.

Thanks,

Stephen Sheppard.

I sort of agree of you... altho I had a 130xe for over 10 years and
didnt have any problems, I prefered the keyboard on my friend's 800.
I've really been looking for a 1200xl which I think is the coolest
looking Atari and is supposed to have the best overall keyboard, but I
couldnt find one in good condition for a reasonable price. This 65xe
is in great condition and it seems to work well... even including the
130xe's expansion port (?!?) so I can't complain.

FYI - the ability to disassembly ROM files is in the latest CVS, so it'll
be in 1.7 (should be soon too).

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

thanks I did look back into the newsgroup archiives and found that the later model North American 65xe's did feature a 130xe motherboard with less memory. This is not listed in the official faq, whoever writes it should update it, the 65xe's with the ECI port started being sold in the US in 1987 according to an official Atari addendum to the 65xe manual (which I was able to find doing a Google search at a very interesing website.. whose name escapes me now...).

Now I am faced with this delemna, my 65xe is in great condition and still has the warranty sticker intact, should I open it up and add the extra 64k to make it a 130xe (asssuming this is an easy mod, which I will not know until I open it up) or should I just leave well enough alone and be happy I have a almost mint condition and rare version of the 65xe...

The Basic ROM seems to be non-standard to me, I haven't been able to find a fitting EPROM. Instead, I used an adapter. Otherwise, you would need a 2764 or larger here. The Os-ROM is in a standard ROM chip that is pin-compatible to a 27128. I have already replaced the basic ROM on my system, haven't tried this with the Os ROM yet, but the pinout is identical and I see no reason why this might fail.

I have no experience concerning EEPROMs, if you have success, I would be curious to hear.

So long,
Thomas

3269. Memory upgrade

I've just tried to install the 256K memory upgrade obtained from
Atarimax. Although the document is great, it references a part (U27)
which doesn't exist on my MB. I serached the internet for schematix of
the 800XL, and I found the U27 in all of them. What kind of revision I
have? It is labelled as 800XLF R-3. Can anybody give me a schematic of
this?

Thanks,
Jozsi

> 800XL?

I'm using an AMD 29F010 (128k) flash ROM in my main 800XL. I've built
a small adapter socket and connected 3 pins to switches so I can
easily switch between max. 8 OSes (actually I use 2 switches, one
SPDT and one DPDT with a neutral position plus two pullup resistors
so I can choose between 6 OSes - this way I "loose" 32k but it's
easier to select and I don't need 3 switches in my Atari).

Instead of the AMD 29F010 you can also use a Winbond 29EE011 or an
SST 29EE010 (these chips were often used on PC mainboards as BIOS
chips, so if you have a dead PC have a look if you can salvage
the BIOS chip). I've tested all three chips and they work equally
well.

But: don't use a ST 29F010, it won't work well! Using it for an XL
OS worked fine, but using it for the "old" (Atari 800) OS failed.
I don't know what exactly is going wrong, maybe some access patterns
put the chip into ID mode or something like that.

Programming the flash ROM from within the Atari is not so easy. You
would need some additional hardware to select the higher address
lines, connect the /WE line, write a flasher program and completely
turn off all interrupts and DMA while re-programming the OS.

I programmed the flash using the new upcoming Turbo Freezer, but you
can (of course) also use an EPROM programmer (just check out if these
chips are actually supported, my old programmer didn't handle the
AMD flash although it should have been supported).

BTW: programming these flash chips is not too complicated, the
algorithms are documented in the datasheets and all three chips
are quite similar. My code also supports the AMD 29F040, a 512k
flash ROM, which will be the default flash chip on the Turbo Freezer.
So if you'd like to have 32 OSes in your Atari that's also possible :-)

so long,

Hias

> call for a 100 Ohm resistor.

Hmm, I don't see why 100R was specified.
I would have thought 75R was more appropriate, to match the cable and TV
impedance.
I'd stick with 75R, unless anyone has a good reason for choosing 100R.

> I meant I wanted clarification/verification on what type of
> EPROMs/EEPROMs will/might actually work.
>
> 2716's? 2818B's?

The Atari machines used mask-programmed ROM chips (type 2364, 23128) because
they are cheaper in serious numbers. And they don't fade (AFAIK). They have
pinouts like this:

http://www.howell1964.freeserve.co.uk/parts/MPROM.htm

while EPROMs have pinouts like this:
http://www.howell1964.freeserve.co.uk/Arcom/J037_SEP.htm#EPROM%20pinouts

and EEPROMs / Flash ROMs have pinouts as per their datasheets.

They have many pins in common, but there are always a few differences.
The links above highlight the differences inside each group, you can work
out the differences between the groups.

The 23128 and 27128 are similar in pinout and have the same 28-pin package.

The 2364 has 24 pins and the 2764 has 28-pins, so that's harder to replace.

> Designing circuits are probably beyond my ability and understanding.

You'll have to get someone else to design the mods if you cannot find them
on the web.

> I would like to learn whether
> EEPROMs will work or not, as-is,
> in the place of the Atari OS ROMs.

You probably won't be able to pop them in there and go.
The Atari does not provide a !WR signal so you cannot write to them in situ.

Thanks for the tip. The Atari should not be trying to write to ROM
locations, so perhaps it has a bug that is harmless to ordinary ROM.

Does this 65XE connect to a monitor? (North American 65XEs connected only to televisions.) If not, then you'd have to add that too. Without monitor capability it's still a 65XE, regardless of how much it's souped up.

BTW, I wouldn't label the warranty as this 65XE's strongest selling point. <grin>

> Cool. Can we see your adapter circuit anywhere?

I wouldn't call it a circuit :-)

Actually, it's just a stack of 3 IC sockets: One 28-pin socket (to
fit into the Atari OS ROM socket), a 28-pin socket with a few pins
cut out and a 32 pin socket for the flash ROM.

The fine thing is that the 16k ROM and the 128k flash ROM have almost
identical pinouts - the flash just has 4 more pins.

The following pins are cut out on the 28 pin socket: 1, 27, 28.
Pins 2-26 connect directly to pins 4-28 of the flash ROM.
Pin 28 (VCC) is connected to pins 32 (VCC) and 31 (/WE) of the flash,
pins 2 (A16), 3 (A15) and 29 (A14) of the flash are connected to the
switches. Pins 1 and 30 of the flash are NC. That's it :-)

so long,

Hias

Actually all 65xe's have a monitor port, including mine, you are
thinking of the 600xl. My 65xe is a later model which uses the 130xe
motherboard. The only difference between this machine and a 130xe
(even the mb says 130xe) is a resistor and 2 less memory chips. The
earlier North American 65xe's used a custom motherboard that was
missing the ECI port and could not easily be upgraded to 128k.

It is in such good condition and it has the sticker intact, I like to
collect Atari stuff as well as use it, so to me it has value being in
such prestine untouched condition, but you right I dont the modern
Atari is going to fix it if anything goes wrong!

Have you ever tried Uniflash for the PC?

On a working PC you hot swap the BIOS ROM then you use Uniflash to flash whatever code you want to the chip. Well, that's theory, anyway. I once tried it to recover from a failed flash but motherboard differences and my unfamiliarity with Uniflash and flash ROMs led to failure.

Thanks for sharing! This is exactly the kind of stuff I want to read about.

->value being in such prestine untouched condition,

Many collectors, in and out of computers, would agree. That's
one reason why you might leave it as is until it's really necessary
to upgrade it.

Actually, the idea of using a flash ROM in the Turbo Freezer came
from Guus Assmann. Torsten Schall then told me about the PC BIOS
chips (he salvaged a lot of them and sent me some for doing tests).

After I finished the flasher program for the Turbo Freezer I had
the idea that I could also use these chips in the Atari :-)

BTW: The 29F010 is organized in 8 banks of 16k that can be erased
and programmed separately. Suits the size of the Atari OS quite well :-)

The SST/Winbond chips are organized in 128 byte pages. Theoretically
one could build a flash disk for the Atari using these chips
(that would be a 1024 sector SD disk). But be careful: the Winbond
chips are only specified for 1k (or 10k, depending on the type)
program/erase cycles. The SST chip should survive 100k cycles.

The programming algorithm of the SST/Winbond chips differs slightly
from the AMD algorithm and is a little bit more timing critical:
if the bytes aren't written fast enough the chip leaves programming
mode and returns back to read mode. When disabling interrupt and
DMA on the Atari, this is no problem.

> Have you ever tried Uniflash for the PC?

No, not yet.

> On a working PC you hot swap the BIOS ROM then you use Uniflash to
> flash whatever code you want to the chip. Well, that's theory, anyway.

I heard of this method some time ago but I have to say that I'm not
too comfortable plugging chips in/out while the PC is running. I did
this a few times with the Turbo Freezer (while the ROM wasn't
accessed, of course) and it often led to crashes (actually, that's
what I expected).

so long,

Hias

I suppose if one had a supply Flash ROMS a 1K write cycle would not be
a huge problem.

I found I only have one old mobo with a 29F010. I'd need more if I
wanted to attempt the Uniflash method for re-writing.

Though I failed with Uniflash I have hot swapped BIOS ROMs about half a dozen times. Once with a DIP-32 and 4-5 times with a PLCC chip. Swapping the DIP was easy. I made a loop of tape to make a handle to wrap lenghtwise around the Flash ROM. Just set the ROM in the socket without fully seating it, boot the computer, hot swap the chip, and flash using the normal method. It was a lot trickier (and riskier) with a PLCC chip. There is not an easy way to make a handle and the chips don't work unless you seat them. I put a piece of tape on the top of the chip but need the PLCC extractor to actually remove the chip. I dropped the chip into the motherboard the first time but no harm.

I understand most of your description of your Flash ROM "adapter" but is there any chance you could post a wiring list or schematic and a parts list. Mostly which model DIP Sockets did you use? Are they all stackable?

I think I first would like to build the SmartOS upgrade (see link) because it can be reprogrammed from the Atari and it provides 512 bytes of non-volatile memory which would have so many uses.

It might be more of a problem than you would at first think. The directory sectors and sector map gets written to quite often with even trivial disk use.

One of us is confused.

I meant the 1K writes limitation shouldn't be an issue when using Flash
ROMs as OS ROMs. It's true one might want to try several
configurations before one gets it right but 1000 attempts is more than
enough I should think.

Hi,
I was going through my 8bit stuff after packing it away 10 years ago and found my Express BBS Pro Disks, but when I try to boot any of them they say "No Dos".
Which Dos does it need? Dos XE/XL? SpartaDos or what?

I bought the APE interface and was thinking of setting my old BBS back up using Express Pro through telenet.
Can someone tell me how to boot this up?

Thanks,
Jay

Micheal I include a link that proves my 65xe is North American and has
the ECI port, because I cant find the site now either. I have talked
to several people on Atariage.com that back it up as well. It seems
to cut costs during the end of the XE lines lifetime they made one
motherboard and the only difference between this 65xe and the 130xe is
one resistor and less ram, it can be relatively easily upgraded to
128k. Also some of these models are known to have faulty GTIA chips.
here is a link to the picture I took of the bottom of my 65xe:

http://members.cox.net/kev77/65xeECI.JPG

Notice the FCC label and the eci port. You can also see the warranty
sticker is still intact but if I did take it apart the motherboard
would read 130xe not 65xe. This is useful info as I was completely
shocked when every faq states emphatically "the NA 65xe does not
feature a ECI port" when infact some do.

Also here is link describing how to modify such a machine to 128k:

That's Ok I'd been excited about two different upgrades and talking
about them both.

I was impressed by the simplicity of Hias' triple stacked sockets but I
also liked the SmartOS upgrade which uses static RAM and has the
benefit of being writeable like ordinary RAM or protected ROM. It's
the former feature of the SmartOS upgrade that I mentioned briefly
earlier.

```
Lots of enhancements for this one - download at:

http://sourceforge.net/project/showfiles.php?group_id=145747

Version 1.7
-----------
Thanks to Steven J. Tucker for giving us many ideas.

New features:
- The dump popup menu has an option to guess byte type. This option
tries to follow the flow of the program beginning with the byte
selected by the user. All data in the flow of the program is
marked as code.
- There are two other options in the dump popup menu to select next
block of unknown type and to change the remaining data to bytes.
- An option has been added to display Zero-Page instructions with
absolute addressing mode as bytes. These instructions use 3 bytes
instead of 2.
- The disassembly now centers the selected line and displays it with
a yellow background.
- Disassembly window has a popup menu which offers options like find,
find next, select definition of a label, select all references of
a label and rename a code label (Lxxxx).
- Double click on a line in the disassembly window jumps to the
definition of the label found in the instruction.
- The disassembly popup menu has an option to return to the previous
position after a jump to a definition or to a reference.
- Mouse wheel is now supported and scrolls the window under the mouse
cursor.
- The File menu now supports ROM file loading and raw file loading.
Only ROM with no bankswitching are loaded.
- 2 sub-menus have been added in the File menu to open recent files
and recent workspaces.
- User labels can be exported in xasm format to be loaded in
Atari800Win emulator.
- System labels can now be unloaded from the Label menu.

Fixed bugs:
- Opcode $B6 produced a bad disassembly.
- When $00 address was referenced, an L0000 was used but not defined
in the disassmebly listing. This label is not used anymore.
- 5200 files are loaded through the 'load ROM file' instead of the
'load binary file'.
- Some Oric files could not load properly because the header of the
last segment did not match the size of the file. This is not any
```

more considered as an error.
- Dialog box for loading sectors from a .ATR is now working fine.

3299. MyIDE for LBA capable drives?

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-29 04:03:02 UTC
From: damage_x@hotmail.com
Message-ID: <1125288182.200456.152160@g43g2000cwa.googlegroups.com>
Source record: 10206

Am I understanding correctly that LBA assigns a straight 28-bit number to each sector on the drive? Using this mode, would it be possible to avoid the slow Cylinder/Head/Sector calculations and simply add some kind of partition offset to DOS's sector number and pass that to the drive?

Hmmm, this is odd. I can't see the disassembly or the equates. I can save the disassembly to disk but I can't see it within DIS6502. All I can see is the segment list and the dump plus two empty windows.

Has DIS6502 1.7 been tested with Windows 98SE because that's all I use? 1.6 worked fine.

The list of new features sounds great.

Eric saw your question and asked me to post this reply (I haven't see it
myself):

I read a reply to your post on comp.sys.atari.8bit. The guy says he has
nothing displayed in the different windows of Dis6502. I know this problem.
It is the font which is not loaded. I had the same problem yesterday. This
is often when you run several version of Dis6502. One of the version does
not unload the font. Then when you run another version, you see empty
panels in the main window. I had to reboot my PC to get the display back.

Source record: 10211

Hi everybody,

I just got an ITT TV2466 stereo tuner. It once was intended to watch TV with an Atari monitor. Unfortunately, I don't have an instructor manual.

Now, I want to use it with my TV! I have an old TV with only 8 channels - much too view for the 20 channels that the cabel company provides.

- I would like to use the TV2466 limilar to a TV receiver of an VCR, where the eight channels are switched to the one channel of the TV tuner. Is this possible? How to find the channel of the tuner?

- What is the meaning of the LED's. OK, I guess the left one indicates that the tuner is set to a channel and the right one indicates mono/stereo. But what to the upper and the lower indicate?

Thanks, Uli

3305. Looking for disk based assemblers.

Newsgroup: comp.sys.atari.8bit

Source record: 10212

I have been lurking around this group for the past 4 years or so just to keep up on current atari events. Well, when I saw things such as the USB cart project, the various IDE mods, and Mr. Tucker's flash cart, I decided to dig out my trusty old machine(s). 130XE, 800XL, original 800...

Well, now with all the crap I have stuffed into my 130XE, it has become a massive hassle to swap carts and reboot the little bastard. So I am looking for disk based assemblers to use.

All I have is the original assembler-editor by atari, and the macro assembler on disk. I am missing the manual for the assembler. I have no clue how to use it. It would be nice if anyone knows where I can find scans of the manual, or anything on it, really.

I'd really like to give the mac65 assembler a whirl, but is it even available as freeware?

I'd like to know what you guys would recommend for a good/decent assembler.

Also, on a side note... is there a version of C available for the atari (hopefully disk based also). So far, the only thing I have really seen is cc65, but I'd rather code on an actual 8-bit. I have it, why not use it?

Thanks guys,

Mac/65 is included in the Pooldisk collection - I don't know if that makes
it free or not. There are multiple postings of the manual for it out on
the web. You can find a collection of assembly disk images here:

http://www.slor.net/a8/asm

If anyone has copyright on any of them and wants them removed (or if you
know someone else will), please let me know ASAP so I can take care of it.

No manuals for either? You may want to find a copy of John Harris's MAE.
There's also A65 and I believe at least one assembler that comes with
the CC65 distribution, all disk based. There were a few tutorials in
Atari magazines, most of which are online, but I don't have the specific
issues. Maybe someone else can help on that.

IIRC: A65 and AMAC don't use line numbers. All assemblers are
indentation sensitive to interpret commands. If you have a specific
question I or someone else in the newsgroup could answer it.
>
> I'd really like to give the mac65 assembler a whirl, but is it even

Yes, the disk based version is freeware and comes with DDT debugging tool.

> I'd like to know what you guys would recommend for a good/decent assembler.

Any of the above are good.

I really loved Speech Technologies TASM on an old '286 back in the days
of MSDOS. You need a method to port the code over to the Atari. I used
both disk transfer utilities and SIO2PC to get it over back then.
Nothing quite like using an IBM editor in 80 columns and compiling 10k
of code in less then 2 seconds on Tandy 1000.

Ooh! I see you have SynAssembler XL.

I remember dumping the Assembler/Editor Cartridge in favor of
SynAssembler (the 400/800 only version). It was fast and easy. I can't
remember all the features it has but Load, Save, ASM, Find, and Dir
commands are pretty straight forward.

I don't recall SynAssembler being a Macro Assembler but I'm not sure.
All the stuff I did 20-25 years ago was pretty simple and I don't do
any assembly now.

Thanks for the post!

Lol. Maybe I should have specified... I have the manual and errata sheet for
the Atari assembler cartridge and have been using it religiously for the
past 15 years, but lack the assembler manual for the AMAC. I bought the AMAC
off ebay a couple of years ago and the only documentation I got with it was
the "Atari Program-Text Editor" manual, and the reference card. On one side
of the card is the reference for the macro assembler, and on the other side
is the program-text editor. I just need to get ahold of the manual for the
assembler itself.

3313. [OT?] Question about Linux AtariSIO

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-30 00:19:57 UTC
From: David Bowden <nospam@spamsux.org>
Message-ID: <IoOdncsXAre7O47eRVn-2w@comcast.com>
Source record: 10220

First off, I admit I am somewhat of a Linux noob, so please bear with my ignorance of the penguin...

Ok, I have been using Linux for about 3-4 months as a server machine and before the Linux install, this machine ran APE for my 8-bit. I'd really like to use AtariSIO so I don't have to reboot the box to Windoze just to use my disk images on my 130XE.

After bumbling my way thru multiple install problems with AtariSIO, (I was missing my kernel headers, as Mandrake/Mandriva doesn't install them by default, along with a few other minor frustrations.). When I "modprobe atarisio", I get "FATAL: Module atarisio not found."

I'm not sure what's going on here, and I was hoping one of you gents use/have used AtariSIO and can give me a clue as to what's going on.

Not sure if this would be considered OT or not... I apologize if it is.

Not sure which version I had; it did not support macros. There is
a
manual on atariland.com. I never did learn to add run/init
addresses with
the Target File option.

3315. The Digital Alternative CD-MAG Launch Issue

Newsgroup: comp.sys.atari.8bit
Date: 2005-08-30 01:45:23 UTC
From: John Kavanagh <cpcoxygen@gmail.com>
Message-ID: <OSOQe.4682$R5.562@news.indigo.ie>
Source record: 10222

Here's information on an new retro magazine you all may be interested in:

The Digital Alternative is an interactive magazine presented on two professionally produced CD-ROMS covering retro / alternative computing and gaming at its best. Each issues, supplied on 2 CD-ROMS, will have over 4 hours of video footage and over 200 pages of articles covering all aspects of retro and alternative gaming/computing.

The retro aspect of the magazine coves home computers and consoles from the 1970's, 80's and early 90's which basically means every retro format you can think of. There will also be alternative content, meaning contents about the CPC-NG, Commodore One etc.

The cost will be 5 Euro (US DOLLARS: $6.10 or STERLING: £3.40) plus the cost of postage and packaging.

We are ready to produce the launch issue but first we need the number of CD-ROMS and Inserts to produce. So if you're interested then register your interest at http://www.digi-alt.net If interested it's important to register your interest as not to under/over produce the CD-ROMs. We plan on finding the number of people interested (by registering their interest), add 10 percent, round it off and produce the result.

You can go to the main site http://www.digi-alt.net to find out more information on the contents of the first issue.

Regards,
John

I must be looking in the wrong place. I'll keep trying.

In the interim I was looking at SynAssembler articles at
Atariarchives.org and learned that there was an enhanced product, F-S
Macro Assembler 40/80, which was compatible with SynAssembler. FSMA
40/80 was disk based and supported 80 columns thru software.

Now I'd really like to find that!

I spoke too soon :) In using the Ape/ProSystem, I had a glitch when I made my image back-ups of the master disks.
But now all is great! I re-copied my floppies to a new image file, then ran APE and made a 16 meg image and copied the floppy images to the HD image and now in the process of seting it up...
It's an old version of BBS Express Pro version 1.0 :) But still works ok...

In the past I also owned/ran BBS Express ST! I wrote 2 programs for it, "The File Transfer Utility" or FTU and the first script de-compiler that I posted on Mark's Board (The, then owner of BBS Express ST!)
Now that I have an Action Cartridge, I might get back into pogramming for PRO...

I didn't know there was ever any support for the Appletalk interface with
the Falcons' built-in LAN.

There are a couple of routes people are taking as far as networking goes:

1. EtherNEC - cartridge port based.
2. EtherNAT - true ethernet support, as well as USB stuff. Not available
just yet, but very soon now.
3. Seems like I've seen some people mention using null-cables to a PC as
well. Not sure.

HTHs.

The Encyclopedia of Game.Machines

With 224 pages, 600+ full colour pictures, This is the ultimate
reference!

Exactly what it says! This is The Encyclopedia of Game Machines!!
Winnie Forster's unique and aesthetically perfect publication is
presented here in in the UK for the first time.
This book was officially launched at CGEUK 2005. All copies were
snapped up within minutes (literally)!

>From Atari to Sega, from Apple to Nintendo DS: The full colour book
takes not a regional, or European, but a global view on 33 years of
onscreen fun and interaction and presents hardware from Japan, USA, UK,
France, Germany and Korea, along with classic software in its
authentic, pixellated glory. Other than the 600+ pictures, exclusively
shot for the

Game.Machines book, it contains extensive indices, as well as 20 pages
of technical data and explanations.

Available in the UK now.

I'll look into the above... Thanks...

I've also thought about porting FoReM over to the pc and make it a
"multi-node" BBS through Telnet..
I started developing an "Internet Express BBS" version of BBS Express a few
years back, but after a
plane accident, I put it on hold... Another thing to bring out of moth
balls :)

When you have built the module you have to copy it (using *.ko)
into /lib/modules/(whatever your kernel version is)/ then run depmod -a.

Good luck,

Mark

I tried to download the stuff some kind guy pointed me to. I installed the Perl thingy, but nothing is happening when I try to start the script. Somebody must have made an easier way than this for getting the Atari music files to normal Atari format?

Any pointers on what to do with the perl script thing or some nicer utility to unsap with?

Take Atarian care

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> atarisio", I get "FATAL: Module atarisio not found."

When you do "make install" the atarisio.o / atarisio.ko module should
be copied to /lib/modules/<kernelversion>/misc. Have a look at
the output when doing "make install", you should see a line

install -o root -g root -m 644 atarisio.o /lib/modules/2.4.30/misc
or
install -o root -g root -m 644 atarisio.ko /lib/modules/2.6.12/misc

(The second line in case of 2.6.x kernels)

Maybe your distribution doesn't look in /lib/modules/<kver>/misc,
in this case just move the atarisio module into the
/lib/modules/<kver>/ directory and do a "depmod -a"

You could also try to do a "modprobe -v atarisio", on my Debian Sarge
box running kernel 2.6.12 the output looks like this:

modprobe -v atarisio
insmod /lib/modules/2.6.12/misc/atarisio.ko port=/dev/ttyS0

Wasn't the wiring list clear in my first post? It's really as easy
as I wrote. But I can create a more verbose description if you like.

Concerning the IC sockets: just use standard high quality sockets
with turned pins, eg Farnell product number 738610.

so long,

Hias

It's me again.
Lets begin convert example sap file. Open windows command prompt (run cmd for
example) and enter:
perl unsap.pl sapmaker_sap_file.sap

Here is an example.
Try convert Reksio_Theme.sap (made by Sapmaker tool) from ASMA Archive
http://asma.atari.org/.

C:\UNSAP>perl unsap.pl Reksio_Theme.sap
Reksio_Theme.sap -> Reksio_Theme.d15: OK
Reksio_Theme.sap -> Reksio_Theme.md1: OK

Thats all !

Good luck !

That's where it fails for me. It doesn't recognize perl as a valid command.
So, I guess I might have downloaded the wrong files?
These are the files I downloaded. I run on, dare I say it, MS Windows 2000.
ActivePerl-5.8.7.813-MSWin32-x86-148120.zip
TD125CC9EF-ASPNPET-9BB0.exe
and the UNZAP.ZIP file containing the one file UNSAP.PL

Thanks, that's the way I did try it, but due to the perl not being a valid
command, it doesn't do anything

I appreciate the help! Take Atarian care

BTW : Any of Gilbertsons pieces on SAP files? Alternate Reality : The City
is fabulous, as well as Passionately. One of the reasons my Atari is still
running and the XBox is put aside. ;-)

Check your PATH environment variable. It should contain a path to the perl
command (c:\Perl\bin as default).

Forgive me, but circuits have always been difficult for me. I'm easily confused by the little details.

You mentioned wiring 3 pins to switches but earlier you said you used two switches, one being DPDT. Does it matter which two pins get the DPDT switch.

You also mentioned pull-up resistors. What values? Where do they connect? in series with the switches?

You indicated pins 2, 3, and 29 of the flash connect to the switches. Where do the other ends of the switches go?

What country do you live in Uli? Personally, I have never seen a TV that only supported 8 channels. I know that some of the old NTSC (North American) televisions had dials that offered 12 channels (2-13) on the VHF band and a whole plethora of channels on the UHF band.

Regardless, I'm intrigued to learn that your cable company offers only 20 ("twenty") television channels to its subscribers. Locally, Canada, our cable company offers more than 60 ("sixty") channels as part of the basic analog package and a couple hundred others as part of the extended digital package. If I recall correctly, there is no redundancy with the analog and digital cable packages.

My best advice to you, Uli, is to get a satellite dish if you're really serious about getting some variety in your television programming.

If you really want to learn some Assembly programming by looking at other people's work, might I suggest that you get your hands on a disassembler and disassemble some compiled code? You won't get any programmer comments by perusing disassembled code, but that's the whole point. You get to try to figure it out for yourself.

When I want to teach myself something, I try to understand the work of others without being lead by the hand through copious amounts of programmer comments. If I can't figure it out on my own, then I ask questions.

You'll probably find that looking at undocumented code is much more stimulating and educational.

I agree. If you notice some of my other recent posts looking for
disassemblers and subsequent involvement bringing Dis6502 back to life,
you'll see I'm doing just that. I guess I'm really trying to hit from 3
angles: disassembled code, nicely written code that is freely available,
and all the books I can get my hands on.

Given the cyclic nature of my time put into learning, I expect to have
something of my own worth releasing by the 800's 50th birthday. :)

If ActivePerl didn't have an installer, typically setup.exe, windoze
probably doesn't know where or what perl is. Also the perl interpreter
may be called something else.

You'll have to give the entire pathname to perl, e.g. c:\some folder1\some
folder2\etc\perl.exe then as suggested. (This also may not work as
activeperl may be expecting some shell variables to be defined, which
won't be, e.g. something telling it the path to it's location and where
the support perl scripts are located...)

There should've been some documentation files in that active perl archive
as well, if there was no setup.exe telling you how to setup the activeperl
environment. (This is as good as I can do, as it has been years since I've
bothered with activeperl, and it just worked for me back then...)

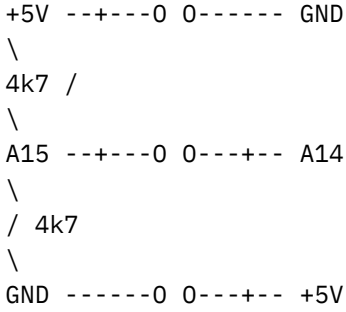
> connect? in series with the switches?
>
> You indicated pins 2, 3, and 29 of the flash connect to the switches.
> Where do the other ends of the switches go?

The easiest solution is to use 3 SPDT switches. Connect the middle
pin of each switch to one of the address lines of the flash
(pins 2/3/29), connect one outer pin of each switch to +5V and the
other outer pin to GND. With such a setup you can control all of the
"higher" address lines and use the complete 128k flash.

My solution (with a SPDT switch and a DPDT switch with neutral position)
looks like this:

Pin 2 of the flash (A16) is connected to the middle pin of the SPDT
switch, the other 2 pins of this switch are connected to +5V and GND
(just like in the first description). With this switch you can select
either the first 64k bank of the flash or the second bank.

The wiring diagram for the DPDT switch and flash pins 3 and 29 looks
like this (this is a look directly at the pins of the DPDT switch).



A15 is pin 3 of the flash, A14 is pin 29 of the flash.

Now let's see what happens with A15 and A14 in the various positions of
the switch:

If you set the switch to the upper position, the two lower pins of the switch are connected to the middle pins. This means, A15 is connected to GND (low) and A14 to +5V (high).

In the neutral middle position of the switch, the middle pins aren't connected to anything. The pull-up resistors now pull A15 and A14 both to +5V (high).

In the lower position, A15 is connected to +5V (high) and A14 to GND (low).

So, we can generate the following address patterns:

pos A15 A14 16k bank number (1-4)
UP 0 1 2
MID 1 1 4
LO 1 0 3

The first 16k bank cannot be selected with such a setup. But that was OK for me. You also have to keep the bank ordering in mind when you program the flash ROM. The first 16k block is empty, the second block is for the "UP" position, the third block for the "LOW" position and the fourth block for the "MID" position. A little bit confusing at first, but quite comfortable once you are used to it.

In my computer I ordered the ROM images in such a way that the SPDT switch selects between "old" (Atari 800 compatible) and "new" (XL/XE compatible) ROMs. With the DPDT switch I can select between 3 different ROMs in each group. That's easier to remember than having 3 SPDT switches.

so long,

Hias

You know I have posted code to this forum only to be blasted by frigging mental midgets as being a fraud and not actually knowing how to program. I don't feel like I was picked out for abuse so much as it is SOP for some jerks to pick apart other peoples' code while they produce nothing and volunteer nothing.

I seem to recall Bob Puff gave the same reason as one of his multiple reasons for not including source code with things like BobTerm. Letting people see your source is like putting a bullseye on your buttocks. If you so much as waste a single cycle in 10k of source code for the sake of clarity some moron will jump off the wall to chastize you about how much smarter they are then you and how you are doing a disservice by posting bad code.

Let them think they're smarter. You are more clever, since you make things and they don't. I don't care if people slam my code, but I am open to suggestions for making it better. It's more of the way things being done I think. What have you made, BTW? I am curious to hear if somebody still does some coding around here. I am planning to start a new RPG, and was thinking of MUX, but have no info on it and no access to one. Also thinking of the USB cart connected to two Atari's, don't know if a HUB would do it for more players. Have you, Slor, started anything yet? Feel like sharing?

Take Atarian care

Probably the things I have been involved in most are screen routines of
one type or another: Started off with 80 column terms back in the 80's.

Did a lot of things surrounding JS ports. Everything from initializing
an attached Ham radio's frequency to RS232 to ~300 Watts of 120 VAC
switching.

There was my 1489 redesign of SIO2PC which was popular of course but I
never wrote a single line of code for SIO2PC or APE. Come to think of it
I did get a ton of negative response about it being a hack and not
following RS232 standards from people that never read the RS232 standard.

I did a whole slew of routines for someone who wanted to come out with
an 8bit WYSIWYG pulishing software. Most of it was pretty pedestrian,
things like shrinking images and expanding them, combining them with
different logical operators. There's probably a disk decaying in my
basement with those routines on them. The guy I did them for never got
back to me other then to say I didn't do routines to accept things other
then divide and multiple by 2 or 3. I wrote back ~'If you want an image
1.5 times as big, use the multiply by 3 routine followed by the divide

by 2 routine.' I never heard another word since. I don't think he liked that answer. The code was rather bloated in that I used look up tables but I don't think it could have been faster.

The only thing left undone that I am still sort'a interested in was the beginnings of a game once in Action! Only got as far as walking around a simple 3d dungeon. It was step movement like Ultima III or Dungeon Master on the ST and I did get a few compliments on it looking better then UIII, but that wasn't exactly a great looking game anyway. I had done a term program interpreter that accepted commands from a bbs. I figured the combination of the two could make for an MMPOG but stopped programming on my Atari when I got too much grief from my S.O.

I mean you couldn't do something like WoW but you could get a simple 3d multiplayer rogue clone going over the internet. Not that anyone would play but it could be done on an Atari with screen flipping to match the speed of just about any game out there now.

3355. MyIDE IDE cable question

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-04 09:30:56 UTC
From: bill@newbreedsoftware.com
Message-ID: <k9zSe.11962$p%3.47607@typhoon.sonic.net>
Source record: 10112

Okay, so I'm stupid and don't know much about PC hardware. :^)

I got my MyIDE cartridge a few weeks ago, dug up a 2GB HD I had sitting
in the 'get rid of' pile, and decided to keep it, and finally tonight
bought an external USB drive enclosure (for the power) and an IDE cable.

So, the IDE cable has one blocked pin hole, near the middle. Since there
are exactly 40 pins on the MyIDE cart, and only 39 on the IDE cable,
I can't plug the damned thing in!

Should I break the pin in question off of my MyIDE cart!? Should I try
and drill a hole in the IDE cable? Should I just get a different IDE cable?
(I had no idea there'd be an issue! <:^( )

Thanks

There's rarely those pins blocked out on IDE cables bought here in Norway,
but I think you should just get another cable. Probably have an old junk PC
lying around, right?

I've seen these cables, mostly in PC's from Compaq (ouch, that hurts just to
type) and similiar ones. Good luck!

Yes, I know :-)

ATM I'm trying to finish the new release of AtariSIO and also put
quite a lot of time into the AtariSIO bootdisk. A Debian package
is scheduled as soon as everything runs fine :)

so long,

Hias

I take a very sharp tipped knife, press the tip into the plug,
and twist gently. They aren't usually embedded so deeply that
it won't be gone in a few twists of the knife. Also a very small
drill will remove it, but be very careful. It could walk and ruin
the plug completely. Good Luck.

P.S., if you are not too picky, I can send you a used IDE cable
or 2 to try out.

Bill Garber

Method 1:
Take a thumbtack and push a hole in it.

Method 2:
Bend back the pin on the IDE cartridge.

No big deal.

Thomas

> the plug completely. Good Luck.

I went the drill route, and things seem to work. At least, I have
drive 1 and drive 2 partitions on my little 2GB HDD! :^) Awesome!

Unfortunately, though, when I run SCANDISK.BAS off the 'UTIL32F.ATR' disk,
after a few moments I get this:

...
Starting MyIDE-DETECT(tm)
Sectors : 63
Heads : 0

ERROR- 3 AT LINE 520

:^(

This is an old Quantum Fireball ST 3.5 Series drive that I shoved in the
cheapest USB external casing I could find at Fry's ($40 USD) and connected
with the aforementioned IDE cable (bought new, it's twisted so it's round
in the middle, rather than a big flat cable)... after drilling a hole where
that extra pin wanted to go. :^)

FDISK.BAS couldn't auto-detect the drive's geometry, so I looked it up on
the web: 63 sectors, 16 heads, 4092 cylinders.

So, maybe this is a bad/dying drive? Or incompatible? Beyond this
Atari BASIC error that SCANDISK.BAS is giving me, is there a way I can tell?
;^)

PS - When's someone going to write a Linux kernel driver for reading/writing
Atari 8-bit/MyIDE formatted hard drives!? >:^) Bwahahahahahah!

Heh, well, I bought it new at Fry's Electronics for about $3 USD.
It has the advantage that it's not all ribbon-shaped, so it can bend and
twist much more easily.

> Probably have an old junk PC
> lying around, right?

Nope. :^)

> I've seen these cables, mostly in PC's from Compaq (ouch, that hurts just to

Thinking back to the few times I've messed with HDDs and CD/DVD drives in
my Linux boxes, the blocked pinhole seems pretty familiar, actually. :^/

It was brand new, from Fry's! Oh wait... Fry's kinda suck. ;^)

(They didn't have a CompactFlash <-> IDE adapter, which would've been the
coolest to use. I have a 16MB CF card sitting around not doing anything.)

Awesome! Is it going to be part of Debian proper? Or are you or someone
else simply going to release a .deb file that people download or point apt at?

(The former would be the best, of course, since you'd have the benefit of
living in Debian itself.)

Has anyone tried AtariSIO on any other Linux platforms? (Other than x86?)
It'd be awesome to get a serial cable for the Sharp Zaurus and run AtariSIO
on it. (It's a 2.4 Kernel running on the ARM platform.)

3366. Free to good home

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-04 22:41:58 UTC
From: Jerry <Jerry@verizon.net>
Message-ID: <WKKSe.9145$9q4.6297@trnddc08>
Source record: 10123

Gentlepersons,

Many years ago I was a devoted Atari user and I accumulated a large amount of Atari hardware. Over the years, my interest waned and all of my stuff got packed in boxes. I'm getting ready to move and have decided that there is no need to move the Atari boxes again.

I don't have a list of exactly what's in the boxes, but I know that there are a couple of 800's a couple of 800XL's, a 400 with a 48K mod, a couple 810's, one with a happy drive mod, an Indus drive, a 410, a printer, a color monitor and a ton of software. A lot of the software is utility and system software, but there are the usual number of games. I also have a number of magazines, mostly Antic and Analog, and books. There may be a copy of De Re Atari, but I can't remember. None of these items have been used for probably 12-15 years.

Anyway, I don't have the time or inclination to pack everything up for shipment. I live in Elkhart IN. If anyone is close enough to come pick it up, it's theirs. If no one expresses an interest with a week or so, I'm going to take it all to the local thrift store for donation. Please respond to fulkersonj@hotmail.com if you have any interest. If more than one person is interested, first come first served.

A last note, I don't have time to sort through the boxes for specific items. It someone is interested, It's take all or nothing. Hey, I'm giving it away for free, I can afford to be stubborn.

Thanks for your time.

Jerry

At first I'll just create an apt repository on my webpage. Maybe later
I'll try to get AtariSIO integrated into Debian.

so long,

That's not a bad way to configure it, if you
have the correct numbers.

> So, maybe this is a bad/dying drive? Or incompatible? Beyond this

You might want to hook it to an old PC first
and low-level format it, then try it on the
Atari. Can the interface on the Atari detect
marked bad sectors? If not, and it has them,
it may attempt to use all of the drive. This
will give you problems.

My program doesn't and I don't think Sijmen's does either. Bad sectors,
especially in the "important" places of the drive, will really screw things
up.

Sector 1, Head 0, Cyl 0 is where the configuration information goes.

In my programs for MyIDE:
Sector 2, Head 0, Cyl 0 is where I am storing partition descriptions.
Also, the last couple of image slots is where I am storing the image
manager configuration and image descriptions.

I have new utilities to support the 3.5F version of the MyIDE software, but
they haven't been posted on-line yet. The versions that are up on my page
are for the old 3.1 version of the software.

Many emulators allow direct access to .bas/.com./exe files...

Failing that, Ken Siders has a great Win utility to manage ATR
images including an Insert Binary option; go to:
http://atari.ksiders.tzo.com/a8emulators.html

An easy way to quickly run simple BASIC program is to use
the emulators cassette functions.

Boot into BASIC, with or without DOS
Choose 'Tape recorder...' on the Atari menu
click browse.. default shows only CAS files, so show all files
select any tokenized BASIC file
at the READY prompt type CLOAD<ENTER>
at the Braaaap! press <ENTER> again
LIST or RUN or whatever

> I would like to run the BAS files directly in Atari800win+
> Is there a utility that easily converts BAS files to ATR files?
> /Aces123

METHOD 1

Put BAS files in any folder on your hard disk

Setup Atari800Win Plus hard disk emulation (ALT+H). Point H1:-H4: to above folder.

Boot any DOS bootable ATR straight into BASIC.

You can load your BASIC programs from directly the virtual hard drive (e.g. LOAD "H1:MYPROG.BAS").

Alternatively you can copy the BAS files from the virtual hard drive to any DOS formatted ATR/disk.

If you want to grab a BASIC program directly from a webpage, select it, copy it, and save it to a folder.

Just as above setup a virtual hard drive. However when you actually load the program choose H6:-H9: which are the same virtual drives as H1:-H4: but when you access the former then Atari800Win Plus automatically does ASCII Line Feed/ATASCII EOL conversions.

Since captured programs aren't tokenized BASIC you need to use the ENTER command (e.g. ENTER "H6:WEBPROG.TXT"). You can then save the program back to H1:-H4: (e.g SAVE "H1:NEWNAME.BAS") or to any DOS formatted ATR/disk (e.g SAVE "D2:NEWNAME.BAS")

METHOD 2

Use an ATR builder program like MAKEATR to install all your BASIC programs into the ATR. Select any format. Boot the matching DOS ATR (MyDOS, SpartDOS, or Atari DOS). Load your programs from BASIC.

METHOD 3

Build an ATR just as in Method 2 but choose Atari DOS or MyDOS format only (not SpartaDOS). Install Matthias Reichl's excellent MyPicoDOS onto the ATR. Now you have a bootable, menu driven ATR/disk that will automatically startup BASIC when you select a BASIC program.

One caveat, BASIC programs that require DOS won't work very well since MyPicoDOS is a game DOS not a full fledged DOS.

MyPicoDOS can also load COM and EXE files automatically disabling BASIC. You can mix different types of programs on the same ATR/disk.

Ouch. That's not good. Either a build problem or (again) some weirdness
with Mandrake Linux.

Try to start from scratch again, unpack the tarball into a different
directory and uncomment the "USE_KBUILD_26 = 1" line in the Makefile.
Leave all other settings at their default.

Now do a "make dep" and then "make". The beginning of the output
of make should look like this:
# make
make -C driver
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
using kernel 2.6 build system
make -C /lib/modules/2.6.12/build
SUBDIRS=/home/hias/atarisio-0.30-pre2/driver modules
make[2]: Entering directory `/work/src/linux/linux-2.6.12'
CC [M] /home/hias/atarisio-0.30-pre2/driver/atarisio.o
Building modules, stage 2.
MODPOST
CC /home/hias/atarisio-0.30-pre2/driver/atarisio.mod.o
LD [M] /home/hias/atarisio-0.30-pre2/driver/atarisio.ko
make[2]: Leaving directory `/work/src/linux/linux-2.6.12'
make[1]: Leaving directory `/home/hias/atarisio-0.30-pre2/driver'

If you get any warnings or if your output differs, please post your
output.

Then, do a "make install". Again, the beginning should look like this:
# make install
make -C driver install
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
if test ! -d /lib/modules/2.6.12/misc ; then \
mkdir -p /lib/modules/2.6.12/misc ; \
fi
install -o root -g root -m 644 atarisio.ko /lib/modules/2.6.12/misc
```

```
depmod -a

Now try again "modprobe -v atarisio".
If this still fails, it's time for another check. Enter "make clean"
and then "make V=1". The latter will cause the kernel build system
to be more verbose. On my Debian Sarge box it looks like this
(long lines are wrapped):

# make V=1
make -C driver
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
using kernel 2.6 build system
make -C /lib/modules/2.6.12/build
SUBDIRS=/home/hias/atarisio-0.30-pre2/driver modules
make[2]: Entering directory `/work/src/linux/linux-2.6.12'
mkdir -p /home/hias/atarisio-0.30-pre2/driver/.tmp_versions
make -f scripts/Makefile.build obj=/home/hias/atarisio-0.30-pre2/driver
gcc -Wp,-MD,/home/hias/atarisio-0.30-pre2/driver/.atarisio.o.d
-nostdinc -isystem /usr/lib/gcc-lib/i486-linux/3.3.5/include

3378. SIO2Linux 2.0 released

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-05 16:33:08 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2005.09.05.16.33.08.542399@crowcastle.net>
Source record: 10135

http://www.crowcastle.net/preston/atari/

I've put out a new revision of the SIO2Linux (formerly femul) program.
This is a simple Linux program for use with a SIO2PC cable. Features
include:

* No kernel modules. It's just one .c file to compile.
* Creates dynamically-sized disk images--they grow to the last sector
written.
* Mount your local file system as a disk--files are mapped to sectors in
a virtual image as you read them.

Enjoy.

Unfortunately, my 800 died on Saturday, and my 800XL needs a power supply,
so I won't be able to test any new developments until I get something up
and running again. (I'm in the Boston area if you have extra equipment to
donate.)

3379. New collection of disk utilities released

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-05 16:51:07 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2005.09.05.16.51.07.786632@crowcastle.net>
Source record: 10136

http://www.crowcastle.net/preston/atari/

Back in the mid 80's, I wrote a sector editor in BASIC. Over several
years, I incorporated additional features and tools, as well as re-wrote
various routines in assembly language for speed. I should have released it
back then, but now I've gone back through it and added a few extra
features. I also re-worked all of the assembly language code.

Features include

* Sector editor
* Show the sector chain for a file
* Disk copying
* Single and Enhanced density support
Sorry, no double-density support
* Tachometer
* Generate the world's smallest Autorun.SYS files

Enjoy!

I tried it, but sadly, it didn't seem to work. (The Atari acted as
though there's no disk drive attached.)

My setup works fine with AtariSIO.

I'm running Debian etch on an AMD Sempron 2200 with an Atarimax SIO adapter.

The no-need-for-kernel-module concept sounds nice. AtariSIO's atariserver
interface is great, though. I wonder if parts of these projects could be
combined? :)

Thx!

3382. MyIDE + HDD in an enclosure (photos)

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-05 20:09:00 UTC
From: bill@newbreedsoftware.com
Message-ID: <wB1Te.12182$p%3.49005@typhoon.sonic.net>
Source record: 10139

The other evening I started playing with my shiny new MyIDE cartridge,
and old spare 2GB HDD I had lying around, and the IDE cable and
USB external HDD enclosure I bought from Fry's Electronics:

http://www.newbreedsoftware.com/bill/news/images/atari-myide.jpg

Last night I tweaked with the enclosure's case a little to get it to fit
as best it can (there's no wiggling room for the HDD, and it's supposed
to _just_ fit, connecting to the IDE pins inside, so it's actually in there
at a slight engle). I also broke the fan holes in the back to let the IDE
cable sneak through more easily:

http://www.newbreedsoftware.com/bill/news/images/atari-myide-final.jpg

Still a little crappy looking, but about as professional as I'll get it. ;)

Looks great to me, Bill, and I'm a hardware guy. :o)

When I'm ready to do such a thing though, I'll more
than likely go with a CF to IDE adapter and have it
all one piece, pluggable whenever I desire to use it,
as are some of the newer devices for our Apple IIs.

View them here at these links:

www.gse-reactive.com

Wow, pretty slick looking!

I wanted to go the IDE->CF route, but as I mentioned earlier, Fry's sucks. ;)

Maybe one day. In the meantime, the HDD route seems pretty slick on its own!

I'll probably show this off at the Vintage Computer Festival (VCF) in
the SF Bay Area later this year.

Yeah. The first link is my store. The drive in the pic is
made by a guy in Germany and we only retail them. The one
in the second link is made by a guy in the US and he handles
his own distribution.

> I wanted to go the IDE->CF route, but as I mentioned earlier, Fry's sucks.

Fry's is ok, but they don't carry everything you might want or need.
I had posted a link to where I get my adapters earlier, and if you
missed it, I can send you the link in email.

Yes, I agree, it's neat looking. Good Job.

That'll be great. Did you ever get to meet the Apple One Replica
designer there? That's a very impressive machine. His rivals the
original in everything but price. :o)

Yeah, I saw it. T'was too late by then, though, but I've bookmarked it,
thanks. :^) I've got a pair of Atari Flashback 2's to buy first...

This is strange. It should actually be "/lib/modules/2.6.11-6mdk/build".

What's the output of "uname -r" on your computer?

Could you edit the Makefile and set "KDIR" by hand to the location
of the kernel source code, then try "make" again.

Can anybody help me to locate the signals on the MB of my 800XLF that
is needed to build the 1MB simm upgrade from Satantronic
(http://www.atari.sk/satantronic/). Unfortunately they have no 800XLF.

Thanks,
Jozsi

Those CF to IDE adapters are great. I have used them in PCs,
and I plan to use one in my server for my 8-bits if and when
I ever get the time and space to set them up. Serial to the
Atari and parallel to the C64. Should prove to be interesting
at the very least.

Great guy and a neat machine. He is the guy who helped me
to make my IIgs ram card a reality. Also seen at gse-reactive.

>

Random question, well sort of anyways:
I did see this project on a web page that I was looking at however at one point it states that the cartridge is for "any" 8 bit atari, however further down the page it entitles it something like XL/XE cartidge.

My question is would this thing work in a 48k 800? (Also, I saw a USB adapter on the same page, any idea if that would work in an 800?)

(I've been digging out my old systems recently, Atari 520ST, IIGS, //c, and the 800. I've had all the others runnning except for the 800 so far, and my floppies seem to have held up rather well, i.e. no dead disks found yet, but I haven't really extensively tested them. All the hardware is up and running as well, excepting for a cranky IB 40 drive for the ST which is refusing to write disks, yet it will read and format them... Need to clean it I suppose, but I recall that it was a cranky drive even when new, and the SF314 is still kicking fine. The 800, well I've powered up the 810 drive which seems ok, but I've yet to hook everything together and see if it still actually works. Sorting out disks from all the systems is keeping me busy, as I never bothered to label many of the disks, they're mixed together, etc. along with dealing with the trials and tribulations of transferring software which is only going to get worse as the 800 has zip in the way of connectability with any other system at the moment, hence my interest in these cartridges, and actually the USB one if the FDI works, then I could probably use my USB zip drive and some ingenuity from linux and images or a compact flash adapter... My only real regret is that I did not get these machines out years ago when old SCSI adapter and the like were available cheap, i.e. the old commercial mass produced adapters...)

Trivia: I did find the instruction sheet for the 32k memory board that I added to the 800 many many many years ago, IIRC it was an Intec 32k board(I think I also recall the packaging originally may have said Mosaic 32k or something of the sort), and IIRC it cost me a ton at the time, many months of allowance and grass cutting profits...)

The MyIDE makes a nice setup. Here's a couple of other possibilities FWIW. I've used the CompactFlash with an (ebay) IDE adapter. It works fine, but as has been brought up before, flash memory is not long-lived with repetitive writes. Most (all?) have built-in error checking routines and some spare cells to compensate. But my mainstay for both the KMK/JZ and MyIDE interfaces is a 2.5" notebook drive housed in one of those "shirt pocket"-fitting USB cases. Notebook drives can use as little as 0.5 amp at 5 VDC. So if you have a good PS for an XL/XE, you can power the drive with no additional PS. My XE uses a 5 VDC, 4 amp regulated switcher, so I have plenty of "juice." I haven't made a permanent connection for the drive yet -- maybe this winter. A neat thing about the KMK/JZ is that it is housed in a nice case, and a 2.5" drive/case will sit right on top of it, using a 3" IDE ribbon connector. It even works out so that the drive is "right-side up." That used to be a big deal, but I've actually seen 3.5" drives that were factory mounted upside down. (Upside down still seems suspect to me.) BTW, at the last report, the KMK/JZ interface still does not work with XL's since it uses the ECI instead of the PBI.

You can use the RTCLOCK to count the jiffies (screen refreshes), and you can use VCOUNT to determine which scan line you're on. Is there a reference that will tell me how to convert those two values into a precise time?

I suppose I could write a tight assembly loop to watch for VCOUNT to change, and then count the cycles until it changes again. I could then do the same for the time from when RTCLOCK changes to when VCOUNT changes.

But if this has been done already, please point me to the documentation.

Also, is RTCLOCK really 1/60th of a second on NTSC, or is it 1/59.94th of a second?

The MyIDE cart that I have, from Atarimax, I think only works with XL/XE.
It uses RAM under the OS, so it can't run some software, including
TurboBASIC XL, which is a shame... I like TurboBASIC XL. :^)

The original Mr. Atari design might work with an 800.

Guh... I'm not 100% sure of any of this, actually. Hopefully someone who's
actually _familiar_ with all this stuff will answer. I'm a total newbie. ;)

> a second?

All this is derived directly from the video timing. The video timing,
again, is derived directly from the crystal oscillators in the Atari.

NTSC machines use 3.579545MHz crystals. A scanline is 228 color clocks,
which is 3.579545MHz/228 ~= 15.6998kHz. Since VCOUNT is increased
every second scanline, the time between changes is 127.39uSecs.

A full NTSC frame consists of 525 lines. One field is 262 lines, the
other 263 lines. But the ANTIC outputs two fields with 262 lines
each (and doesn't care about interlacing). This means
RTCLOCK is updated 59.92 times per second (that is 16.688msec).

Search for ANTIC.PDF with xlsearch and have a look at page 4
(this is where I got my information from).

BTW: On PAL machines the crystal is 3.546894MHz and a frame consists
of 625 lines.

so long,

Hias

thanks for the reply. I was sort of guessing that the IDE cart might need 64k or more to work, as I suspected that the driver, plus maybe some buffer space would use some RAM. 48k is pretty bare, but it'll run everything I needed from the 8 bits.

I looked, I think, at the atarimax page again yesterday, and it looked like the USB cart should be for any 8 bit, as it says that in several places. I just wonder how much memory that would take away from my 48k, but it should solve my software transfer problem. (I do have an old 835 300baud modem that I could use in a pinch, but I doubt the usefulness of that route... Incidentally, I opened it up the other day and was surprised to find the board EXTREMELY simple, and bearing a Racal Vadic copyright, and, alas, no simple RS-232 interface as I had hoped(maybe I can hack it though...). They used to make some of the best modems...)

Maybe I'll have to track down a way to add some more memory to the 800, or get lucky and find a 130xe or 800xl or XF551 or similar in some garage sale or thrift shop. (I plan on looking any ways, as I'm hoping to find a hd interface card for the IIgs, and maybe an amiga, mega STE, falcon, and/or TT(I wish...), and a hd interface for that as well...)

I got your lawyer letter but you and your lawyer made a few mistakes,
look here:

http://tinyurl.com/dg5w4

where did i specify SpartaDOS 3.3?
where did i specify BBS Express Professional?

did i not state all non fte products which would mean those not
developed or created by K-Products or even Stephen Carden?

that bill of sale from Bob Klaas to you does not specify any icd source
code but only source code produced by Keith Ledbetter, Chris King, and
later Stephen Carden; in fact, this bill of sale from Bob Klaas to you
only specifies BBS Express Professional (and all source code) it does
not inlcude SpartaDOS 3.3 (for which I have never stated an interest
in) or anyother icd or even fte products; instead the last line of the
paragraph in bold reads: "including all copyrights to any soruce code I
Robert Klaas have to BBS Express! Professional and submit."

your lawyer also states it was his understanding that Robert Klaas had
previously contracted with Mike Hohman of FTE to produce SpartaDOS 3.3
for BBS Express Professional; this agreement between Bob and Mike did
not relinquish Mike's ownership of any icd or fte products. The only
thing Bob had ownership of was his own source code and bbs express
professional.

in regards to icd or fte products, you still have not provided any
proof that you own anything other than bbs express professional.

i will be having an intellectual property lawyer look at the documents
from you and your lawyer.

since i am now rarely online i will post again as soon as i find out
some more information.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

<snip>

Also, in case anyone cares:

5.25" drives require a longer seek time than the 3ms default of TOS(or at least the v1.0 that I have with my 520ST). I had forgotten about this, but while digging around for drivers for the IB 40 drive I came across an article by Dave Small re: adding 5.25" IBM drives to an atari, along with commentary about how someone else said that they needed a longer seek time than the default. From this info I dug up a lharc archive containing the original article by D. Small the additional commentary, several utilities, and the most important one of all, one that resets drive b seek time to 6ms. End of story: the 5.25" drive appears to be working fine again.

(The odd thing is that the only driver disk from IB Computers that I can find right now, only has a formatting program, so I must've lost another disk somewhere as I'm sure that they'd have shipped a similar utility, and in fact I think that I vaguely recall having an auto folder program to do the same thing, and forgot about it all those years ago as well... I suppose that I should also dump this into the ST newsgroup... gack crossposting... hope this helps someone else some time...)

3404. Spartados Help Needed

I have been using Spartados (32g) for a little while now and have hit a roadblock. I can't seem to change directories (back or forward). I can if I use the Menu shell. (menu.com). The "CWD" command should do this but doesn't. I'm an old MSDOS user and am still familiar with the command line. I have tried every way possible-like: D1:CWD>DOSUTIL OR D1:CWD >DOSUTIL OR D1:>CWD DOSUTIL. I have a Supra hard drive setup using Spartados and it won't work there or on single floppy disks. I have an ATR with Spartados on it from Steven Tucker (APE) with a subdirectory on it and it won't work there either. What am I doing wrong?

3406. 800 died

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-07 23:25:14 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2005.09.07.23.25.13.371404@crowcastle.net>
Source record: 10063

My 800 died Saturday after nearly 25 years of flawless operation (besides a space bar repair and non-Atari memory failure). I opened up the cartridge door, pulled out the cartridge, and closed the door. Only the power didn't come back on. No light or anything.

I took it all apart, cleaned off all the dust (there wasn't much), and pressed down on any chips that weren't fully seated (one was working loose, but I don't think it was a problem yet). I used a multimeter on the opposite side of the switch to check that it isn't broken. I tried a different power supply.

What can I try now?

If I disconnect the power board from the rest of the system, is it safe to apply power? If it's working correctly, will the LEDs light up without the main board attached?

And by the way, what's that connector in the back of the main board? I'm guessing it was used in the factory to test the board; does it have any practical use?

Try using the 'CD' instead of 'CWD'. Some later version of SDOS had that changed.

I don't know where you're talking applying power.
I would generally say no, don't apply power yourself.
I can't remember, but I think, as you mention, there's a
power board, a main board, then the three types of plug-in
boards at the back of the main board. That edge connector
at the back was, I think like you say, for manufacture testing..

The nice thing about the 800 is its' modular design. All you need
are some known good working boards and you can isolate the
problem a great deal. I suspect your power board, since no
LED light comes on. Not much help. I have a complete set
of extra boards that could be used for such testing. Maybe you
could invest in a second 800.

That's right, but with the MyIDE-OS burned on EPROM, most of that stuff will work just fine. SpartaDOS v3.3 works with MyIDE for instance. The news (as far as I know it) is that Sijmen (Mr. Atari) is working on debuggin a version 4.0 of the EPROM based OS. The newest versions of the MyIDE OS are awesome. Sijmen's put a lot of work into them.

The MyIDE flashcart is your normal MyIDE adapter plus a 1MB flash cartridge, so it can be used with the old 3.1 version of the MyIDE OS. This version has a bug that can corrupt your partitions though. (copying from one MyIDE partition to another causes it.)

>The original Mr. Atari design might work with an 800.

As far as I know, only one MyIDE was made for the 800, and it's in the possession of Dr. Clu. The production MyIDE adapter won't work with the 800.

Sijmen will have the definitive answers to your questions, of course.

Shawn Jefferson

Is the MyIDE-OS-on-EPROM compatible with the hardware (the Atarimax MyIDE
plus flash disk cartridge) that I have? :^)

> The MyIDE flashcart is your normal MyIDE adapter plus a 1MB flash
> cartridge, so it can be used with the old 3.1 version of the MyIDE OS.
> This version has a bug that can corrupt your partitions though. (copying

I saw that mentioned around here earlier. I'll try to remember not to do
that. :^) I'm still a little confused as to how partitions work, and it
took me a while to realize that the whole "Start + Reset" 'image' interface
had nothing to do with D1:/D2:/etc. drives. :^)

Someone needs to put together a _newbie_ howto. :^) In the meantime, I'm
muddling through the current docs well enough, though.

Thx!

Yes, if you have the MyIDE 3.1i OS rom switched in, the cartridge will
use that instead of replacing it with the MyIDE RAM OS. Having it in ROM
will work much better for things like loading games.

Hi,

I have recently acquired an Atari 130XE and a 1050 disk. Unfortunately I
do not have a dosk diskette. Is there someone available to send in Italy
a copy of a DOS disk?

Thank you
Alfredo

Hi iMac, what's the weather outside? Maybe you should stop surfing the 60+ channels of your cable and explore the real world.

I have a small Sony television from the days of the C64. Back then, I needed a small TV with a Scart connection. I only watch telly once in a while so I don't care about size and stuff.

Actually, I'm not sure how many programs I could receive. At most 15 of them are of interest anyway. (I don't need a homeshopping channel and there are too many stupid people on the street - why should I watch them talking on TV?).

And: It would be cool to use such an old device as the ITT TV2466.

If nobody mails you a disk, you can make a SIO2PC cable and boot the
Atari off a PC with your real disk jumpered as drive 2. Format and write
DOS files to the real drive and you can then switch it to drive 1 and
use it to boot.

3423. Atari swapmeet to be September 10

I'd be happy to send you a couple of DOS'es. What's your address? And do you have any preferences? DOS 2.5 is a must in my opinion, MyDOS 4.53, a Sparta DOS and I can't help it, I like DOS 2.6f. Let me know and I'll send it to you!

Take Atarian care

3425. Re: MyIDE + HDD in an enclosure (photos)

Source record: 10083
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

...as a side note, there was apparently only a single disk included with the IB drive. It contained at auto folder with the res.prg program, and a disk formatter. I learned by trawling through the STart magazine archives on atari-archive.org that the res.prg MUST be the FIRST program in the AUTO folder, and also, that, apparently, it REQUIRES a disk in the IB drive. The last part seems to be false as I did a quick experiment, and it seemed to still work when booted without a disk in the drive. I also recall that I must have had problems with this driver (changes seek rate) in the past.

The other program that I had was called dseek.prg and it changes the seek rate for drive B to 6ms. I obtained this program from the umich ST archive, Disk(IIRC) folder contained in the ibmdrive.lzh archive. This archive also contained the previously referenced articles by Dave Small and others about adding IBM drives to an ST and the necessity to increase seek time for 5.25" disks.

All of this was tested on a 1M upgraded 520ST, TOS
1.0, no other upgrades or hacks. The drive is the IB40, or the 40 track version of their 5.25" drives, and was hooked up to a standard SF314 DSDD drive. I'd presume that there are other utilities out there that will do the same, but in my quick search this was the best that I could turn up, and it would seem that using the dseek.prg is the most reliable way to go at this time.

Thanks for the reply. It's as much as I had surmised from the
advertisement page.

Any idea about the USB cart though? That page even to the end seems to
support it's "for any Atari 8bit"(or similar) listing...

I suppose in the mean time, I'll look out for some XL/XEs around, or at
least some extra SIO cables to hackup for serial support, as this all
started with a desire to rescue my oldest personal data from cassettes &
floppies, along with a game of Universe perhaps on the real thing.
(Devolved from originally just wanting to play a game of Universe, but the
emulators didn't do a very good job on linux or OSX, or the disk images
weren't quite good enough.)

While I'm also thinking of it, do either of you happen to know if someone
found some modern connectors that can be made to work with SIO ports? I'd
been kind of thinking maybe some older automotive molex connectors or
similar maybe, but don't have anything handy to try sizewise. (The only
info I've seen to date was something about someone else had written they
couldn't find anything suitable and recomended sacrificing a genuine SIO
cable, adding the circuit "board" and appropriate DB-25 or 9...)

thanks

It was one of Atari's best kept secrets; I seem to recall an article in
ANALOG (I think) about it being an expansion connector similar to that on
the XL/XE's. Not fully compatible, of course.

the connector on the 400/800's is not for expansion like the PBI/ECI
on the XL/XE's it was merely for testing those computers. There is
nothing secret about it.

Its included in the 32-in-1 OS upgrade here:

http://www.atarimax.com/warpos/

Or you can download it from Mr. Atari's web page and burn yourself a copy
onto a 27128 EPROM, which you can just put into the OS ROM socket. :)

This text file might be helpful/interesting, it came with the original
distributions of 3.2g.

(I grabbed it from the archive of the Cleveland Free-Net Atari SIG at
http://www.atariarchives.org/cfn/12/03/0051.php , where I see I originally
posted it 11 years ago(!)).

-Michael

What's new in SpartaDOS version 3.2g

****

Version 3.2f could only access drive
ID numbers from D1-D8. Now, you can
access drive D9.

****

A filespec that does not contain a
drive number, such as D:TEST, will
now default to your currently logged
drive on the command line.

For example, if you are logged to D4:
a filespec of D:TEST will be converted
to D4:TEST, instead of D1:TEST as it
used to be. This change can be very
useful when running programs from
different drive numbers, since you
can access files with D: and they
will automatically be taken from
whichever drive the program was
was started from.

You must now be careful however, to
always type D1: when you need to
access drive 1 specifically.

****

A file will no longer be destroyed
when copying it to itself. The DOS
checks for this condition, and will
report a 'File exists' error.

Commands such as:

D4:COPY D4:TEST

will no longer destroy the file TEST.

****

All command line input, including all commands, files, and drive IDs, can now be entered in either lower case or upper case. Lower case was only partially supported in version 3.2f.

****

Some commands have been changed, to make them more compatible with the X cartridge, as well as making them easier to type. The following changes have been made:

CWD has been changed to CD.

CREDIR is now MD (Make Directory).

DELDIR is now RD (Remove Directory).

Note that with the Remove Directory function now called RD, the RD.COM ramdisk handler needs to be renamed to RM.COM in order for it to work.

(This will be the name of the MARS8 compatible driver to be released.)

****

There are many additional error messages, so you should no longer see error numbers on the command line.

****

A system lock-up bug has been fixed, when the clock wraps from 12-31-1999 to the year 2000.

Also, the day of the week offset has been corrected for years after 2000, in the new TDLINE program.

We are 5 1/2 years 'ahead of time'<g>

****

Program files containing a RUNAD, can now be reentered with the RUN command after returning to DOS. The normal process of saving the starting address for a .COM file into Sparta's internal variables, was disrupted when the file contained a RUNAD address. This has now been fixed, so all program files will behave the same way, whether or not they include the RUNAD address.

****

Several changes have been made to the keyboard buffering routines. When holding a key down for auto-repeat, the buffer will not fill up with excess characters that the application program hasn't used yet. There will at most, be one additional character in the buffer during a key repeat.

This means that when you release a key, the repeat process stops right away, whereas there could have been many additional keycodes 'stacked up' when using version 3.2f.

The key combination Shift-Control-Esc can be used to clear all of the keys currently stored in the buffer. This gives you a way to cancel everything in the buffer when a situation may require you to abort.

****

The 1200XL key functions such as DMA off, keyclick toggle, and keyboard lock, now work properly.

****

The key buffer NOW DEFAULTS to OFF due to incompatabilities with certain programs. It can always be activated as part of a STARTUP.BAT file using 'key on' (even in lower case), if you would like this feature enabled.

****

The AINIT command was removed from the command line. However, the XIO Atari

format function can still be used
within application programs.

****

Even with all these changes, the DOS
file size has been reduced by 260
bytes, and the lomem has been dropped
119 bytes. If you do not have a PBI
device, your lomem will be at $17A2.

Users with a PBI device will find
their lomem at $1BA2, since the buffer
space uses 1K at lomem, instead of the
$D800 PBI area.

****

FTe has decided to release a special
3.2 'gx' version that can bring
memlo back down to $17A2, by placing
the disk buffers under the OS at
$C400. This has an added benefit of
using a full 2K of buffer space,
instead of the 1K space allocated at
memlo, and will help the DOS run
faster.

However, SpartaDOS 3.2 'gx' is NOT
COMPATIBLE with BASIC XE, or any
other programs using the RAM under the
OS from $C400-$CBFF. It is provided
for those users who don't require this
compatibility, and who would like to
have the additional RAM available.

NOTE that if you ARE NOT using a PBI
device, (such as an MIO or Black Box)
you do not need the special 'gx'
version, and will already get the 2K
buffer space and $17A2 lomem with
using the STANDARD 3.2g version.

****

SpartaDOS 3.2g and 3.2gx are being
released as Shareware on an AS-IS
basis. If you do happen to discover
any incompatibilites, please don't
hesitate to let us know, so that we
might be able to fix the problem
in any future revisions.

This upgrade was made possible by
everyone out there who took the time
to register 3.2f Thank You!

****

If you like what you see, you may
register 3.2g by sending $19.95 to

Fine Tooned Engineering

PO Box 66109

Scotts Valley, CA

95067

This will get you all 3 manuals in
addition to the SpartaDOS Toolkit.

3442. [Computerfest-Announce] Computerfest this weekend

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-10 04:22:12 UTC
From: Sid Pacman <8-bitter@atari.old.folks.home>
Message-ID: <Pine.GSO.4.61.0509100008460.28534@furyy1>
Source record: 9999
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I just received this rather late bulletin on Computerfest in Dayton, Ohio, this weekend. In past years this show was usually held in August and for a long time it was one of the biggest computer shows in the northeast.

---------- Forwarded message ----------
Date: Fri, 9 Sep 2005 20:57:05 -0400
From: Nancy J. Christolear (njc at dmapub dot dma dot org)
Subject: [Computerfest-Announce] Computerfest this weekend

It's that time again -- Time for the area's largest computer and technology show at Hara Arena, Computerfest(r).

When: Saturday, September 10, 2005 from 9:00 AM to 6:00 PM and Sunday, September 11, 2005 from 10:00 AM to 4:00 PM
Where: Hara Area Complex, 1001 Shiloh Springs Road, Dayton, OH

Computerfest: Still the area's largest computer fair, featuring vendors from across the country offering the widest selection of computers, computer parts, software, and seminars available under one roof.

Dayton LANfest: Having broken all records for the largest computer gaming event in Ohio, Dayton LANFest continues to grow into one of the top computer gaming venues in the nation. This show's LAN Party will feature gaming tournaments for the PC AND X-box. Over $3,500 in prizes and giveaways will be available to the 250 plus players expected to participate. Registration is $35 in advance at www.daytonlanfest.com or $40 at the door.

Intel is offering a rare opportunity to Computerfest® and Dayton LANfest participants.

Need a new PC? Ever wanted to customize and build your own PC using state-of-the-art components at a great price? Then come to Computerfest, where you'll be able to purchase and build your own personal computer at the Build-Your-Own PC Workshops sponsored by Intel.

Intel will be sponsoring 3 build your own computer seminars at Computerfest®. Participants will be offered the opportunity to buy parts for a significant discount and then walk away from the show with a computer in hand. See full details at www.computerfest.com.

Tickets for Computerfest are $7 at the door or $5.00 at our preshow outlets. Tickets are available on line at www.computerfest.com. They may also be purchased at various locations in the Miami Valley

listed on the Computerfest website. Your Saturday ticket also gets
you into the show on Sunday.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Computerfest Staff

I live 20 miles from Hara Arena and plan to attend mostly for seminars. I'm confused as to why this is being posted in Atari newsgroups. Other than SCSI drives I haven't seen anything relating to Atari for many years. It's a good show especially the free seminars but anyone expecting Atari is going to be disappointed. Correct me if I'm wrong.
IIRC their is an Atari show in Columbus this weekend.

->I ... plan to attend mostly for seminars.

The seminars are another good feature of this show.

->I'm confused as to why this is being posted in Atari newsgroups.

Atari is a brand of computer. Atari users are computerists.
This is a large show with lots of things that are of interest to
a great many computerists. 'Nuff said.

-> ... anyone expecting Atari is going to be disappointed.

That has been increasingly true of all computer shows and ham-
fests for more than a decade. But it isn't a good reason for
Atarians to put their heads in the sand and to try to shut out the
rest of the computer scene. There's still a lot at these shows
that's useful to us -- or at least many of us (perhaps especially
8-bitters) -- and then there's always the possibility of finding a
direct Atari item for a song.

->IIRC their is an Atari show in Columbus this weekend.

I noticed. After all, I'm the one who posted the information
about it on this newsgroup!

this has been around for a few years now. One of the earlier models
looked alot like an Amiga 1200! Now if they would just make a Black
and White model with silver function keys!!!

Slor,

I have written a *very* simple viewer that does what you ask.

At:

http://www.leehanken.pwp.blueyonder.co.uk/atari/ATASCIIView.zip

my apologies for the bugs e.g. lack of proper scrollbar functionality,
I didn't have much time to spend on it

Lee

Thanks Lee! If you care to share the source, I might be interested in
implementing the scrollbar/paging stuff. Feel free to contact me via
email.

This is a question for everyone who is using a Lantronix device with their BBSs... Which settings is it that affects how baud rates are reported? I'm using BBS Express! ST, and it always reports no baud rate, i.e., "??? baud" and I'd really like for it to report it correctly. A (very) few games depend on the reported baud rate to work right.

Thanks everyone.

Howdy folks

Before everybody turns on Lance, let me explain some things.

That Lance has put a lot of money into getting the rights to certain
things doesn't mean everything will be available. Hardware costs a lot
of money and not many people are willing and/or able to spend money on
Atari 8 bit stuff. Or that Lance will give people stuff, that people
have sent money for to Mike.

Stephen Carden has offered to sent people source code to stuff, so that
they can publish it. What doesn't he do so himself? And why is he
backing out, not that the going gets rough? And why are there a lot of
Atari 8 bit guru's that don't really like mr. Carden?

And if you have an old car in the back yard, that you never use, and
that's not worth much to anybody, would you not appreciate it, if
somebody asks if he or she might take it of your hands, instead of just
taking it without asking?

3453. Best place to get SIO to PC cable?

Newsgroup: comp.sys.atari.8bit

Source record: 10010

I have been using 8bits since 1979 (I was 9) unfortantely I sold my last 8bit (130xe) a few years ago thinking I would never use it. Recently I bought a 65xe to replace it but I dont have the patience or the money to collect every cartridge for this system, so I want a SIO2PC cable.

Where is the best place to get one? Also I dont want to spend a fortune for something that is such a simple little device. Is there an easy guide to making one? I do have an extra SIO cable, is there anything I should know before buying one/making one?

Any info is appreciated! Thanks a million.

Kevin

J131, Artur Burzynski (sp?) sells a real nice cable on EBAY. Got mine
for good auction price of $10 plus I think $8 shipping and handling
(from Poland). Good quality 1-chip (14C89, I think) SIO2PC cable.
The simple circuit is built into the SIO shell, so no ugly project or
breakout box. It works well.

I had an incompatibility with an ATR8000 (a rare problem I'm told) but
Artur stands behind his work and sent me a different design, no extra
charge. However, his basic cable should be perfect for you.

I'm not sure if Artur sells direct but here is his webpage.

http://j131atari.webpark.pl/

Sidenote:

I recently started using AtariSIO (bootdisk version). Of course
wouldn't you know it, this software is not compatible with the original
2-chip MAX232, SIO2PC design, which is what Artur used for my
replacement cable.

I needed yet another new cable.

This time I decided to build my own but I'm not that handy with a
soldering iron. So, I studied the plans for the MAX232 1-chip design
but made it easier on myself by using the MAX233 chip. This meant I
could leave out 4 capacitors and eliminate 4 or 8 solder points.

I didn't have a schematic to follow and the pinouts are different than those of MAX232 but the circuit is easy to build (don't laugh LLppwhite). All that I needed was some prototype board, the MAX233, a 20-pin DIP socket, 1 capacitor, 1 diode, 1 resistor, SIO half-cable, and a female DB-9 connector and shell.

My cable is pretty ugly but it works great and, as it turns out, this cable even plays nice with my ATR8000, not that I use it much anymore.

There are many varieties of SIO2PC. You'll find a few schematics below.

http://www.geocities.com/atarimods/atari.html

The 14C89, 1-chip, SIO2PC is even easier to build than my MAX233 model and the 14C89 IC costs only around $0.50 compared to $5+ for the MAX233.

Good luck on whatever you decide.

Regards,

Stephen Sheppard

Mine came from AtariMax, and I had to add the cable
to it coz theirs only is the actual SIO2PC unit, and
I haven't tried it as yet, plus no idea if it's the
14C89 or MAX233, but I'll find out soon enough.

> I had an incompatibility with an ATR8000 (a rare problem I'm told) but

I'm not sure, but isn't the 14C89 a one way chip and
you actually need an 14C88 along with it?

Again, I believe the MAX232 is a one-way design, while
MAX233 is a two direction IC.

There are a lot of serial designs that are easy to
build, and if you are handy with those things, I'd
suggest it. Helps you to know how it works, and why.

Can you use the signals from Freddie chip as if it were the Satantronic
XEGS upgrade instead? Not entirely sure what the 800XLF is either, so
how many ram chips do you have? Do you even have a Freddie
chip(CO61991)?

Depends, if it was my defunct 1985 VW they would be doing me a favor. If
it is one of my vintage motorcyles that I am actively working on, there
would be trouble.

People tried to explain the issues to me regarding compatibility with
certain real hardware but it goes right over my head. Something about
tri-state.

As for MAX232 vs MAX233 they both do the same exact function just
MAX233 has integrated capacitors while MAX232 does not. Both IC's have
dual transmit/receive units.

At the link I listed you'll see a couple of single chip designs
including the 14C89. No you don't need another chip.

I would have given Steve Tucker a free plug, just based solely on the
reputation of his products, but I can see that he capable of doing it
himself :) Shameless! (Just kidding Steve!)

Stephen Sheppard

You can download the SIO2PC program for free and it works fine. But I would spend the money and get APE. It is well worth the money and more. I have used both and it's no contest. You can do so much more with APE.

Same basic way you make an external cable, but instead of attaching to the
wires in a SIO cable, you solder it right to the connector inside the
machine. Mount a DB9 on the back of the case.

I have the SIO2PC from AtariMax and just purchased the software not to long ago. No comparison to even the free version. So much more added for capabilities! And he always improves on it. You will need an SIO cable, but usually comes with the 9 pin serial cable.

The only problem I had with it, is that I needed to have the Atari computer plugged in and turned on to properly feed enough power to the SIO2PC adapter. But works slick!

Hi,

May be my questions are stupid but if someone can help me to
understand the differences between the Atarimax products :

Atarimax MyIDE+Flash IDE :
If I understand well, with this card, i will be able to connect an old
IDE HD. But what is the function of the flash component in this case ?

Atarimax FLASH Carts :
In this case, I don't understand !
How does it works, can i put some software from ATR (on my pc) to the
cart and how ?

Atarimax/ABBUC USB Cart :
I understand it's a product to interface some USB components to make
backup for example (but does someone tried to make an other
application ?)

Thanks by advance, I'have an old 800XL and these products are very
nice.

Not yet but as my SIO and SIO2PC cables keep falling out of my 800XL I
was thinking about doing an internal interface.

Patrick's Atari 8-bit Mods site has a couple of good examples. Take a
look.

http://www.fonck.nl/atari/

Patrick put his SIO2PC interfaces inside an 800XE and a 600XL. One
uses a DB9 connector and one uses a PS/2 style connector. Both use a
1489 chip.

I was thinking about using an RJ45 connector for mine.

Anybody able to pick up a couple for me? I am located in Norway and has no access to Wal-Mart. Also would like the second Flashback. I'll PayPal money for shipping and a little for the effort.

Take Atarian care

I've seen the Atari Flashback (not sure which version) in shops here in the Netherlands. IIRC it was a shop called "kruidvat". But it's been a while. Guess that means you don't have to find a Wal-Mart to find a FlashBack.

CU Mathy

PS it came in a red box, with joysticks that looked like they would be used on the 8 bit Atari.

I could do this for you. Purchase of 2 items would
be $46.00 to me, then $29.00 shipping to you, plus
a little for my effort. The total for just getting
the items to you is $75.00 USD, and $10.00 for my
services. A total of $85.00. Let me know by emailing
me at the reply to sender address. It is not munged.

Thanks,

Bill Garber

This has gone completely beyond that IMO. I am probably the #1 advocate of intellectual property rights in the group. Lance does have some rights, just not the blanket ones he claims. I was kind of offended in a way I haven't been since the Derek 'you are all thieves' tirades.

It's more like Lance is saying ~I had some work done on SD so now I own all the rights to that version and then fires off a preemptive threat. What he would own the rights to is the added code. He can argue you have to remove his code from that version of SD, but that is it.

Another car analogy, I let you use my car, you put an new air filter on it and say you now own it.

The funny part is that this 'car' in question has less value then my busted VW: A derivative work of a freeware OS for use with an obsolete concept, the bbs. I only mention this because there are still people with valid business models out there for making at least enough money to cover their Atari habit. Ape for Windows, Atarimax, SIO2PC cable makers, etcetera come to mind for a way to advance the art and make a couple of buck$.

You can download the manual from the site for nothing. I have a real Atari8 setup (800XL,floppy drive, Supra hard drive and Commodore monitor) another 130XE hooked to a PC using APE. For transferring files from one to another it can't be beat. You can download Atari8 files from the internet on your PC and then convert them to use with APE or a standalone Atari8 setup. It has all these functions built in and the tech support is great!

Its too bad they arent a '800 on a FPGA' like the DTV-64 is for the C64.

It would be great to have a '800 on a board the size of a playing card.

>May be my questions are stupid but if someone can help me to
>understand the differences between the Atarimax products :

Steve Tucker would have the definitive answers, but since he hasn't
answered yet, I'll give you some info since I own all three of these.

>Atarimax MyIDE+Flash IDE :
>If I understand well, with this card, i will be able to connect an old
>IDE HD. But what is the function of the flash component in this case ?

The flash component is for storing programs that you would like ready
access to (such as programs that people have written for MyIDE or sector
copiers, games, etc...) It's writable again and again, so use your
imagination and come up with some set of utilities where having access to
them almost instantly makes your Atari experience better.

>Atarimax FLASH Carts :
>In this case, I don't understand !
>How does it works, can i put some software from ATR (on my pc) to the
>cart and how ?

Yes, exactly like that. Steve's done an excellent job at making a perl
script that will build a "flasher" disk for your Atari that lets you put a
ton of binary file games/programs, entire ATR games, even multi-disk ATR
games (this requires some light programming work). There are images that
will run Ultima IV, Ultima III, Conan, Summer Games, etc.. from cartridge.
I'm putting the finishing touches on a Ultima II flash cart that I hope to
release sometime soon as well. You can even save your game to cartridge!

Next to the SIO2PC cable, these things are the best thing that has happened
to the Atari 8-bit in recent years IMO.

>Atarimax/ABBUC USB Cart :
>I understand it's a product to interface some USB components to make
>backup for example (but does someone tried to make an other
>application ?)

I have one of these, but haven't done much with it yet. The problem is
that drivers are still in development. A mass-storage driver is still some
time away, AFAIK. Still, it's very cool to hook up a USB device to your
Atari! If I remember correctly, there has been some games release that are
patched to work with various USB devices, such as steering wheels,
joysticks, etc.. even a USB keyboard driver.

I was going to suggest that your number for freddie would make sense being that it is a PAL Freddie where mine is a NTSC Freddie, but looking at Jindroush's site that you posted he shows a PAL XEGS with the 'NTSC' Freddie? Prolly just a boo-boo there?

OK then, motherboard wise, yours would be the same 'type' as an older 65XE which means you need to wire in a CO25953 chip to split Freddie's CAS signal into two CAS lines, one for main memory and one for the extended memory that you'll be adding. I would think this extra work required would best be avoided by using a 130XE to start with instead of the 800XLF you are talking about doing. But if it's the only one you got and you want it badly enough, I suppose one could piggy-back the CO25953 somewhere onto another chip and then hook up all those traces by wire that you don't have on your board. In other words, you first have to make your 800XLF into a 130XE for the most part and then apply the satantronic stuff on top of that. Best Electronics would have the CO25953 chip but you are on the wrong side of the pond for cheap shipping, I just tried his web site and it's down??? Hope it comes back online soon.
http://www.best-electronics-ca.com/

You'll need a 130XE schematic to see how to add in the CO25953 chip and wire it correctly, wouldn't hurt to have a 65XE schematic either. Don't be too surprised to find that the 65XE numbers for resistors, etc. match those on your board, the same is pretty much true between 800XL and 130XE too.

I understand the next Flashback (which is being worked on now) will be
based on 8bit/5200 tech and feature some kind of cart port.
Interesting, finally another 8bit model!

Alright, I need some help here...

I have a 1025 printer that is malfunctioning. What it does is, it prints about a 1/4 inch of blackness for each line I ask it to print.

I ran a test in BASIC (LPRINTs) and at one point, it did print about 5 lines of text, then it went back to the black spots. I haven't been able to get it to print right again after that.

Can anyone shed some light on this?

Thanks

I don't think he mentioned what will be in the FB3 though yet. The only official "hint" from Curt was that there "might be" a FB2 portable variation with LCD screen.

He said it will feature 8bit tech, but in what form factor and how it will be implemented are still a suprise. I havent heard of a portable fb2 with lcd and I doubt one would be mass produced by Atari (altho I know people are making them already) simply because the cost would be too high for the price point they need for all in one toys.

From the Atari 2600 to the Atari 7800 is 8-Bit technology. When he
sent me a preview unit for display at a show, afterwards, he mentioned
that he was looking using real hardware for the next project meaning a
true 650x chip along with other chips.

As for the LCD, this was posted by Curt in the AtariAge forums.
Surprised me as well, but is what I read. Can't be that much as you
can get a GBA SP for $80. I am willing to be people will pay $80 for
a portable 2600. I doubt it will use 2600 cartridges, but more of a
memory card type system, so Atari can release more multi-game paks to
make it more appealing to users.

Corey

when I say 8bit I am referring to the 400/800/xl/xe/5200 it is a
commen way to refer to Atari's first series of computers.

>As for the LCD, this was posted by Curt in the AtariAge forums.

I'll believe that when I see it!

What you may want to waste some time on is a goggle search for "Nintendo on a chip" or maybe NOAC.

There are some cool implications. Other then the price of them appears to be dirt cheap, they have relatively low power comsumption, and appear to be quite hackable.

My experience with just about every micro producer of late had been nothing but grief. Either they wanted $7,000 for their development kit or 100% of their inventory or production went to cell phones. Looks like these NOAC are out there in several hacks so at least you can get your hands on one.

I recently dug my 1025 out of the closet and ran a few LPRINTS thru it. It did the same thing yours did, but mine had a mud wasp nest on the drive belt. Cleaned that off, let it run for 5 minutes and it prints just as good as the day I bought it.

Give it up for the longevity of Atari hardware!

That would be awesome;-).

It occurs to me, that all this redesign of old hardware may lead somewhere. If Atari make enough money out of it, there could be a future for Atari branded consoles. Just a thought, and probably a few years away.

Did anybody here attend the Atari swapmeet in Columbus? If so, please let us know how it went. When I got the last-minute news about Computerfest being on the same weekend I decided I had to give priority to the Dayton show, so unfortunately I missed the Atari event (again).

I hadn't been at Computerfest for about five years so there were big changes since the last time. The sponsoring club has reportedly gone thru organizational changes over the years, and what with receiving the e-mail announcement a mere one hour before the day of the show, it's no surprise that the show is no longer up to the level of past decades. That's a diplomatic way of saying that it was down to about 25 dealers and several hundred people attending, or about one-tenth of its size in the former glory days.

Small tho it may be, this show is still well worth attending if you're a bargain hunter. It's mainly laptops now, and they're very cheap these days. Computer innards and electronic supplies and parts, as well as Windoze software, were plentiful. And the numerous free seminars appeared to be very well attended.

I looked high and low but didn't see a single Atari item. (Of course, there were all kinds of things that could be USED in connection with Atari in one way or another.) But there was one display of 'classic computer' interest -- in this case, 16-bits: an Amiga dealer selling software including emulations for Windoze, Linux, and even the Apple 8-bit. (I wonder if Atari ST-ers are doing as well as this these days!?)

Since space for this show was arranged in connection with the big Dayton LANFest computer gaming event, the best that we can hope for next year is probably that Computerfest will survive but it would have to be based on the same kind of deal. If so, that portends another "conflict" with the traditional weekend of the Atari swapmeet.

Did you want one original flashback, and one flashback 2.0 ?

If so, that will be $20 for Flashback, $30 for the Flashback 2,
$35 to ship and $10 for me, for a total of $95.

Keep in mind that the 2.0 is not yet in stock, but can be preordered.

No particular ones, I just want to be able to use them in demos or
something. The two pieces of music I would love to have is, Alternate
Reality : The City and Passionately, but I think they are in a special
format, coded note by note, by the brilliant Gilbertson (I think)

I used to maintain the Atari 8-bit section of the UMich archive, but then they closed all external accounts, so I no longer had access. I was mostly through organizing things in there, so what organization you do see is my fault. ;^)

I'm sure it'd be easy enough to mirror the UMich stuff somewhere, these days. (At least the 8-bit Atari stuff, which is what >I'd< personally care about!)

Back when I maintained it, and Shareware.com was created by C|Net, I got them to add the Atari stuff to their search index. Sadly, they lumped the Atari 8-bit in with the Atari ST stuff. *sigh*

Thus, XL Search was born. It's kinda been born again as XL Search 2.
I really need to get off my butt and finish updating all that code. :^P

he implied there would be some type of cart port, but he didnt
elaborate. The FB2.0 sort of has a cart port too (at least it is
designed to accept one). I am hoping this new device has something
built in and doesnt require soldering. It will be real interesting
to see this. The last 8bit was the XEGS right? That came out in
1987/88'ish? It's been awhile.

Hello, The flashback 1.0 is on sale where I live. If you are
interested in one or two I will charge you the retail price
(16.99+tax) + actual shipping and you can add whatever you want extra.

You will need to send the money Paypal. Thanks and contact me
at this email: kev242@gmail.com

Technically speaking, the Atari 2600, Atari 5200, Atari 7800,
Atari 400/800/XL/XE/XEGS computers and Atari Lynx handheld were all '8-bit'
systems.

But, around here when we say "comp.sys._atari.8bit_", we're talking the
8-bit line of computers, starting with the 400/800 and ending with the XEGS.
(To a degree, that also includes the Atari 5200 game system, which was
more or less a stripped-down Atari 800 computer with no keyboard and
apparently very crappy controllers that were prone to breaking. :^))

So yeah, XEGS. That was really just an Atari 65XE with built-in
Missile Command, and a detachable keyboard, sold as a 'game system'
at around the time Nintendo was huge in the market. D'oh!

Anyone out here correct me if I got any of this wrong... ;)

3524. 9v power supply repair

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-15 20:55:16 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2005.09.15.20.55.15.873809@crowcastle.net>
Source record: 9981

In relation to my earlier post about my dead 800, it seems that it has died in such a way that any power supply that I've tried to use it with is now also dead. My multimeter doesn't show a short, but I have a bunch of CO17945 supplies that don't seem to put out any current now.

Is there a fuse inside or something simple that I can repair? I don't see an obvious way of opening them.

wow talk about stating the obvious, I dont mean to sound like an AHole
but this is like the 3rd time someone has brought this up on this NG
in the last week.

And it's not just "around here" the 8bits (ie 400/800/xl/xe) were
commonly referred to as "8bit Atari's" since the 80's (in magazines,
on bbs's, etc..)

3526. Battlesphere

Hey guys,

I know these may not be the perfect groups to ask this, but I have been dying to get my hands on a copy of Battlesphere. Now anyone who watches eBay can clearly see the prices go into the $500+ range. Now I know I'm not going to want to play this game for very long, so I feel I don't need to own it.

Therefore... I was wondering if someone could rent their copy of Battlesphere to me for a couple weeks to a month. I'd be willing to pay $20-$40 or something that's fair for this service. I imagine many jaguar owners would be willing to pay this too ;) I have references so you know you'll get it back and you know I'm good for the rental money.

I'm in the US, but that doesn't really matter much for something like this.

Thanks,
Mark

My 800 power pack (USA, 9 VAC) had a weird little "fuse". It was just a small piece of PCB material, about 3/8" x 1/4" in size, with a fine filament running across it. Not glass and no fuse holder. I can't remember if it was installed on the primary or secondary winding of the transformer.

My pack has been taped shut for two decades. I don't remember how I fixed it but I shutter to think what I probably did.

Today, I would repair the break where the internal fuse is and then install an external fuse holder.

There's no value on the internal fuse so I would pick a value for the replacement that would be appropriate to the rating of the transformer plus a percentage. Don't know what that value should be though.

I'm not recommending that you attempt to repair it yourself. I'm just saying that's what I WOULD DO. (There, I've covered myself. LOL).

Can anyone recommend a general method for selecting a fuse value?

Stephen Sheppard

Hey Mark,

Get a cheap flight to the UK for the weekend 22-23 Oct, and come to
Jagfest UK. You can play Battlesphere for two days solid if you like...
;-)

Or you may be able to persuade one of the owners to part with one for
around $250 equivalent.

Coda.

3536. Re: 9v power supply repair

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-17 00:36:28 UTC
From: RetroJess <RJH4JHH2@peoplepc.com>
Message-ID: <gyJWe.12609$9i4.2539@newsread2.news.atl.earthlink.net>
Source record: 9991

Those power bricks are mostly glued around the bottom and must be
broken apart for entry. Mine all had fuses inside which I
replaced with
those plastic in-line pig-tailed Radio Shack fuse holders
threaded thru
holes I put in the side of the brick. It is now accessible from
outside
with no need to break it open again.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Source record: 9994

Greetings all,

Just quietly announcing the new retro mag that I'm working on...
RETRO:BYTES. It's obviously going to plug the hole left by Retro Gamer,
which sadly folded recently (unless the rumours that someone is going
to buy it and relaunch it are true. If they are, then we'll have two
dedicated magazines + gamesTM - and that would be fantastic!) Anyway,
if you want to follow the making of issue one, head over to
http://www.retro-bytes.co.uk/editorslog.rtf and there's an official
forum over at http://www.retro-trader.com/forum

A temporary web site will be up and running sometime next week over at
http://www.retro-bytes.co.uk/ - please note that this will be temporary
this time around, and, apart from the fact that I'm very busy, I'm
NOT a web designer.

Any questions or comments may be posted on the forum, or if you prefer,
you may email me... if I get the chance, I'll get back to you!

Regards,

Shaun.

Source record: 9898

Jerry Fulkerson!

You may have seen Jerry post a while back that he was looking to get rid of all his 8-bit stuff prior to a move, and I was lucky enough to become the recipient of it this weekend. Except for the gas I put in my car to make the trip upstate, I got a great pile of hardware, software, and more technical manuals that I could ever read for the low low price of FREE. The guy wouldn't even take money for gas after offering to meet me partway down to save an hour from my trip. Needless to say, I couldn't wait to start going through the 9 (yes, 9) boxes when I got home. Rumor has it there may even be one more hiding somewhere in the Fulkerson garage...

I will be doing my best to pass on the favor by offering up a number of the items, such as some of my now duplicate books and carts, to anyone who is close enough to pick up or is willing to pay the shipping to get them. Right off the bat, I can tell you I'll be looking to pass the cassettes and the ANTIC magazines (and there's a lot of them) on to someone who will have more use for them than me, so give me a yell if you're interest. The rest I will post for grabs after I have finished sorting through stuff. Here's the haul:

http://www.slor.net/a8/photos

Thanks again to Jerry for the ultra-generous donation to Slor's 8-bit collection - should he happen to ever read this group again. For the rest of you, I thought I would share this excellent experience dealing with a former Atarian.

Well, there are two 800s stacked, and below them is an 800XL.

Anyone know anything about that monitor? It's a Sakata SC-100, and I had
never heard of it before.

The other item I know I don't have use for is the XMM801 printer. If
anyone has use for it (and/or the spare ribbons), let me know.

Looks like it's 1980 again (except for the 800XL)! Nice score there!

My Atari joysticks are crap (except for a rare Newton Design). If you
will be parting with any of the third party joysticks I'm interested.

3545. atari flashback 3 - USB port

Newsgroup: comp.sys.atari.8bit

Source record: 9902

I know this is not a trivial hack, but would it not be swell to add a USB port to the Flashback 2 so you can attach a memory card reader so you can play atari cartridge images (.BIN) on it. That would be the killer app for this, cuz then people can program their own Atari games and not have to burn any EPROMs or anything. Please request this in the Flashback 3.

Can these drives work with an Atari8? They have cables coming out of them but also have connectors on the rear of the case. Can you bypass the dedicated cable and hook up your own 50 pin. I have seen a couple lately on eBay for not much money.

I think you're talking about and ECI to PBI
adapter. It is used to attach and MIO or Black
Box to the 130XE. Is this it? The 130XE has
a ECI port. It is a cart port plus another port
that adds up to a PBI port.

Yes, but you must have the correct host adapter. I have one of these
Supra ST boxes, and it has a 3.5" Quantum SCSI drive in it. That means
that you pretty much have to have a CSS Black Box as a host adapter,
and it needs the parity option. The BB is still (IMO) the king of the
adapters, but the KMK/JZ or MyIDE adapters are definitely excellent,
lower-priced alternatives. -Larry

Yes, the MIO's were designed to be attached to the PBI on the XL's (not 1200). The ICD 130XE adapter had the ECI (male) on one side and the PBI (male) on the other with *two* cart ports on top. The BB, on the other hand, is designed to mate up to the 130XE and uses a ribbon cable to attach to the XL computer. The 130XE adpters are *rare*. If you do find one, have your wallet prepared.

3556. 8-bit stuff to unload...

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-20 06:22:03 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns96D7DE9B2864emuslor@216.196.97.136>
Source record: 9913

I've been sorting through my recent acquisitions, and below is the current list of items I'd like to pass on. Give me a yell if anything tickles your fancy:

20 program cassettes
- Claimed by Frank.

Any spare joysticks that work
- Claimed by Stephen.

ANTIC magazines (most of the issues from 1983 to 1989)
- FREE for pickup or paid media rate shipping.

Atari XMM801 printer (yet untested, missing clear plastic cover, 4 spare ribbons)
- FREE - This one is going in the trash unless someone wants it.

Books: Mapping the Atari (Revised Edition, Chadwick), Your Atari Computer (Poole), and Atari BASIC (Albrecht)
- Asking $10 + media rate shipping for all 3.

If anyone is looking for a particular hard to find program on floppy, feel free to drop me a line. I now have a LOT of disks (many of which I'll never use) with a number of utilities and games that look extremely cool. Some originals and a bunch of other stuff.

Also, if you're looking for any obscure technical or software manual, I may have it in one of the numerous binders now in my posession.

Last but not least, anyone remember the Rampower 48K memory module for the 400 by Axlon? I found info on the company, but I could not find any trace about this memory unit.

Thanks!

No.. in fact if you look at the design it's a single layer pcb with no ic's
or anything..Looks VERY simple.

3561. Typical problems with 850s?

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-21 03:09:30 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns96D7E168BFD09emuslor@216.196.97.136>
Source record: 9918

I had two 850s, neither of which I could get to work with my communications software. I figured it was not likely they were BOTH bad, but I have proven myself wrong by seeing a third finally work. Is there a typical thing known to go wrong with these that I might be able to fix in order to revive one of the bad ones?

thanks

> I have the Supra interface... <

Hi Michael-
The short answer to this is "very, very unlikely." Virtually all
3-1/2" SCSI drives have default 512-byte sectors. I don't believe that
the Supra interface was ever successful in getting past 256-byte
sectors. The Supra supposedly could use the Seagate 225N (5-1/4"
imbedded SCSI), because some variations of that could be formatted down
to 256-byte sectors.

Now it gets more complicated -- there are SCSI software tools available
that will *supposedly* allow formatting *any* SCSI drive down to
256-byte sectors. Personally, I've had no luck doing this for the MIO
(also 256-byte sectors). And that still doesn't take into account
other technical issues with "modern" drives. But good luck if you try!

Source record: 9923

In my past experience in fixing 850's I remember finding a bad transistor or two that inhibited SIO communication to the computer. This was usually related to the computer not able to load the R: handler from the 850. There's a 2N3904 transitor (Q103) and a transistor array (A109) CA3086 (Atari Part # CO10174).

Sometimes the 6507 that's used in them goes bad.

It's been over 10 years since I repaired a bunch of them. That's about what I can recall of the more common stuff that goes bad in them.

Do you mean it's an IBM AT style printer interface? If so can it be
configured as LPT2:

I've been wondering if the PPJoy driver will support a second Atari
Joystick via a second printer port.

PPjoy works great in Atari800Win Plus (and pretty good for MAME).

It's actually called "Card?/AT". It's made by MPP, has SIO plug on one end
and standard Centronix printer interface on other. No switches like the
Graphics AT had.

I don't suppose there's any way to tell from a visual inspection of the
board... I don't have the tools to figure much out otherwise, so perhaps
I'll try mixing and matching some parts from the two of them and hope to
find a working combination. :)

If I can get one back working, I'm thinking of experimenting a little to
see if I can link the 850 together with a MyIDE so I have a little all-in-
one unit stuffed into the 850 casing.

Then again... It's been so long since I looked at the MyIDE, I forgot it
requires connection to the CPU. Was thinking it only needed SIO pins.
D'oh! :) Shows you how much Slor knows about hardware.

Neat version. Popcorn's actually a Jean-Michel Jarre song.
I've heard it on the Atari a bunch of times, in fact. (Probably the first
time I heard any of his music.) Tetrix has some of his tunes, in fact.
I've also got a collection of Amiga MOD music files of various interpretations
of "Popcorn." :^)

I'm not sure whether it was ever cracked to .COM type format but
the best Atari 8 bit database always used to be SynFile+.

I have been playing a little with the 6502 cross compiler CC65
which creates .COMs from C source and its quite possible some
open source C database (or an old MSDOS one) could be compiled
with minor alterations, although disk and memory is limited on
the 8 bits.

Simple answer is an inexpensive clone game box that lets you play old Atari games.

Complex answer is how they do it. Pirate Nintendo on a chip emulating an Atari 2600. People have hacked cartridge ports onto these things so they can play NES cartridges. Rumor is next round will be a native Atari 8bit on a chip.

This answer is misleading. I know of noone that has hacked a NES
cart slot on a flashback. There are 2 versions currently. V1.o was
rushed to market and it is as you say a NES on a chip with ported 2600
games. The FB 2.0 is a 2600 on a chip and many hacks exist for this
model that allow you to add a cart port and run 2600 games.

The FB 3.0 will be some type of 8bit (400/800/xl/xe/5200) on a chip.

Let's hope the 8bit version (i'm most excited about this one) includes
ability to hack and add sio port and maybe even pbi.

You probably found this in the FAQ (section kept by Freddy Offenga):

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package..... : compiler, editor, library, sample game
features..... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

3593. [ANNC] Dis6502 1.9 released

Newsgroup: comp.sys.atari.8bit
Date: 2005-09-25 16:48:26 UTC
From: Slor <semaj@rols.ten>
Message-ID: <1127666906.f44d8cc8a51f2d63da0b6ccf88ed0175@teranews>
Source record: 9850

```
This is a major release and perhaps the last for a bit, including
segment and byte modification as well as a small assembler:

http://sourceforge.net/project/showfiles.php?group_id=145747

New features:
- Bytes in the dump window can be edited.
- A small assembler is included in the dump window.
- A log window displays log and error messages. No more message box.
- Segment properties (start address and type) can be modified.
- Added an option to split a segment
- Added an optin to remove bad segments (generated by xmodem padding).
- Ability to generate relative labels for an address range
- New dialog box to customize default path for all kind of files.
- Output format is now saved in INI file
- The address of a label is displayed as a comment when selecting a
line in the disassembly window.

You are correct. One of them has been modified as well with normal/slow
toggle, knob for slow speed adjust, and a note by the dips that reads "aux
4 up protect off" (as if the dip switch functionality has been changed to
suit another purpose).

my question:
http://www.lawguru.com/cgi/bbs/mesg.cgi?i=646134828

their reply:
http://www.lawguru.com/cgi/bbs/mesg.cgi?i=226057143

in other words, just as i had suspected, Lance Rhenquist would need to establish copyright ownership for which he obviously has not and cannot; that bill of sale from Bob Klaas to Lance Rhenquist only specifies BBS Express Pro and certain (only certain but not a blanket coverage) source code written for SpartaDOS 3.3 including code written by Bob Klaas, Chris King, Steve Carden, and others mentioned in the bill of sale. Lance Rhenquist not only does not hold the copyrights to any FTe or ICD products nor is he the copyright owner of said software as he has not been able to establish ownership. As I stated before, I don't even think he has the source code to any FTe or ICD softwares excluding that particular code written by Bob Klaas for SpartaDOS 3.3

Somehow I do not think Mike Hohman is going to come after me or anyone else who uses or disects or enhances SpartaDOS, Action, or anyother FTe or ICD softwares; but if Mike were to come after me, he'd also be able to go after Lance as well, correct? After all, if we want to get picky, Lance maybe illegally copying ICD and or FTe softwares and selling it for a profit (and at the same time claiming false copyright ownership).

Lance has nothing on me (or anyone else who chooses to "hack" SpartaDOS), nor has he any ICD or FTe source code as he has claimed.

This matter is now put to rest; Do not be afraid to do with SpartaDOS or Action! or BASIC XE or other ICD / FTe softwares as you will (i guess so, or at least until the true Mike Hohman or true copyright owner speaks up and requests a stop to this)

Well that is good news since I sell AtariMax's cart versions of OSS
programming software like Mac/65, Action, BASIC XL, and BASIC XE. I

was under the assumption that these were in the public domain now?

I have also reproduced the BASIC XL manual in PDF form and will be selling repro's of the PDF in printed format. Currently working on Action!, then Mac/65, then finally BASIC XE. PDF is available free from the site, the the manuals will be for sale minimally over the cost of printing.

Are we talking _synthesis_ or _digitization_? :)

For example, Poker Sam was synthesized, whereas Ghostbusters was digitized.

Yes, that's why I said if Tumble Bugs counts, cause that's synthesized also.

And an obvious I forgot, Pop'N'Rocker (Parrot program) has digitized sounds.

digitized? well then... Whomper Stomper and Et Phone Home are the
only ones that come to mind.

8-Bit Classics <corey@8bitclassics.com>:

>Well that is good news since I sell AtariMax's cart versions of OSS
>programming software like Mac/65, Action, BASIC XL, and BASIC XE. I
>was under the assumption that these were in the public domain now?

Nope, not unless they were put into the public domain by the copyright
holders.

They probably fall more into the realm of AbadonWare. Copyright laws (in
the US and any country under the Berne Convention <IIRC>) extend for at
about 75 years (depends on a number of factors) and they could bring a
lawsuit at any time. It's different than trademark law where you have to
protect your trademark or risk losing it.

There is the issue of damages though... not too much money changing hands
with this old software. Still, you are taking a certain risk selling
someone else's work.

Don't get the wrong impression-this is all just information. I'm all for
keeping the 8-bit alive.

Sorry, but that's not correct. The "enhanced" version of Ghostbusters
uses the same speech engine that Kennedy Approach uses ("Electronic Speech
Systems Berkeley" IIRC), it's both (mostly) synthesized.

Another game - though most likely only available in germany - was "Nadral".
This one was digitized speech.

So long,
Thomas

Hi there Vidar,

I am happy with my quite large collection of Atari stuff, the favourite is probably the Atari 800, which with its 810 disk drive looks super cool. It is the perfect style item representing year 1980.

I use it to write assembler programs occasionally.

Sadly, most of the collection is packed in large boxes, waiting for the day that never comes, when I can open a mini museum. Museum sounds boring, doesn't it? It should definitely be an action filled museum.

There probably is at least one Atari club in Sweden, but I am a lone Atari ranger.

From 1995-2000 I bought lots of Atari items on flea markets. Today almost everything is gone. The only thing I can find is broken Sega Megadrives (Genesis).

I don't have a problem getting permission, as I have received permission for reproductions on couple other items. Don't even have a problem paying for the use on items also as long as it is fair. But until them, specifically on these items, it will be a wait and see I guess. I have had so many requests, finally got some people to send me their copies of the manuals to reproduce. Just decided to offer printed versions for those who don't like reading on the screen. Just ordered a copy for myself to view before make it public.

(sorry for the slow reply)

Lol, it wasn't exactly stored in a closet... I stuffed it in a shed at my parents place several years ago after being evicted from my rental house. The landlord died, and his kids kicked me out. I had nowhere to put my beloved atari equipment, so it got stuck in a shed, exposed to high humidity, extreme summer heat, and bone chilling winter cold. Only thing that was in need of cleaning was the 1025, but all the pens for my 1020 dried out. :(

Considering the lousy location I stored itin, i think I was incredibly lucky all I had was a wad of mud in the drive belt.

I have a 130XE with various mods already performed to it, and I am ready to upgrade the memory.

After reading an article in Antic Vol. 7, #7 by Dr. Brilliant, I noticed you start loosing things after the 320K mark. At 576, you loose the built in self test (big friggin deal), but the 1088K mod kills the built in ROM BASIC.

I would like to retain my built in BASIC, but could care less about the self test.

Anywhere I can buy the 576K upgrade? Or find a schematic & component list to build my own, and maybe a place where I can buy the shit I need for it.

I don't know of any.

But it maybe on the net somewhere.

I've tried to contact ICD, but get no reply regarding Atari stuff.

If not, someone who has one with the right knowledge and time could
come up with a diagram or schematic.

I wonder since it has 2 cart ports if more than 2 could be made in a
design?

Not sure if it would be useful or not.

A problem with the old ICD stuff is small market and obsolete designs.

Just as a for instance, you would want an XE adaptor *IF* you had a MIO. The MIO's were designed to use Zip<?> RAM which I doubt is still being manufactured. No one will ever make the old MIO's again. Not trying to be brutal, but the way to do it would be buy an 800XL to use any old MIO someone finds because it would be cheaper then trying to get a run of XE adapters made.

I think a good test for viability would be: Would a good designer use the same parts today? There was some stuff like a 6551 in the MIO that was good'nuff to still be used, but the way RAM expansion and a scuzzy hard drive were added is very questionable.

Faster/cheaper/lower current/static CMOS memory is available that eliminates the need for refresh. IDE is ubiquitous and is the way to go.

About the only thing it would change in the way we work is to have huge battery backed up RAMdisks so we wouldn't have to reload whatever we wanted to work with that day.

3629. How to use DOS

Regarding FTE,

Has anyone had any contact with the owner(s) of FTE regarding the ICD
Atari
8-bit items that they suppose to now own?

I would like to know if they (FTE) have any plans to sell now or in the
future any of the ICD Atari 8-bit products that they got from ICD, if
they
have anything left??

I would like to see SpartaDOS X supported and improved upon if
possible. As well as some of the other software and hardware.

I find 'File number mis-match' for 164. Could be
the ATR is corrupted. Seems like you have to say... D:SHAMUS.BIN or
D1:SHAMUS.BIN
I'm not sure.

Hi Ben,

Have been trying to mail you but your replies comes back as emails with
nothing in them (getting paranoid). I'm interested in one of your books
and trying to find out the UK postage costs or if you'd be interested in
doing a straight swap for one of the PeST mouse interfaces.
http://www.retro.dial.pipex.com/pest/

Thanks,

Aly

Hi again Ben,

Have just picked up your messages, eventually telnetted into the POP3 server
as my provider recently overhauled their web client to make things
easier....

Awww, really dissapointed. Have been hunting for that book for ages :-)

<<ST Disk Drives:Inside and Out>>

Is earmarked for Exxos's and my next embedded ST project.

Thanks again for replying several times, apols. Keep up the good work. :-)

Friendly regards,

Aly

3636. FS : Many boxed+new ATARI 2600/800 XL/XE games

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-01 02:33:54 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <1128134034.881653.54120@g47g2000cwa.googlegroups.com>
Source record: 9893

Hello,

I can offer these games, boxed + instructions, still sealed in some cases.

I can ship worldwide and I'll accept paypal.

Most of the games are PAL versions, if NTSC is not mentioned.ATARI 800 XL/XE cartridges are NTSC, but also work on PAL machines.

Please note that I'm in Germany and shipping can be expensive.

Because of the high shipping costs etc., please try to buy games for at

least 30.- , because I cannot send single games for 1,50 or 2.- / package materials are too expensive for small packages.

It's possible to send up to 150 games in 1 package, please ask if you're interested.

I can give you pictures/scans of the games, if you want.

email : ulrich_sternaxe@gmx.de

Neither of those seems to work either. I notice that the names when I view the directory seem pretty long, things like FLIPANDFLOP. Are those names too long for 2.5? I'm using Atari800Win 800 OSB. Should I be emulating on a newer model?

> Now I think the problem is that I'm using a big .ATR file (its not the
> standard 720 sectors) Might I need a better DOS? Where can I get one?

In my experience, almost all games on ATRs are configured as a SS/SD dos
2.0/810 drive (719 sectors, with 707 usable), or as a dos SS/ED dos 2.5/1050
drive (1023 sectors with 1010 usable).

So if your using DOS 2.5, you should be fine, but if not...

http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm (appears to be
down at the moment. I hope it's just temporary.)

https://www.chebucto.ns.ca/Services/PDA/mydos453.dcm Dunno which emulator
you're using, but you might be able to use dcm images with it. If not,
you'll need to convert it to an ATR. Here's one of Mr. Tucker's utilities to
do just that: http://www.atarimax.com/imagic/download/imagic95.zip

ftp://ftp.atari.art.pl/stuff/mirror/homepages.paradise.net.nz/atari/atari/atr/apps/Mydos%2
04.53.zip
(thanks to XLSearch & Bill Kendrick!)

Also, if you download APE from www.atarimax.com it comes with several ATRs
and at least one ATR of MyDOS 4.53 and SpartaDos.

MyDOS is so very close to DOS 2.0 & 2.5 that you should just be able to fire
it up and run. If you need to know anything else, check out Mathy's page
above, when it comes back up.

Good luck with that.

Ahh, Yes. DOS 2.5 can't do a large ATR. You need
SpartaDOS, maybe MyDOS, or a boot loader image.
FLIPANDFLOP is legal, it is 8+3, you just don't see
the FLIPANDF.LOP the period. I don't think any DOS
does more than 8+3. Many game files can't load from DOS,
therefore, you need a menu or boot loader image.

For David and others wanting to diy upgrades on their Atari 130xe computer, follow the link http://www.textfiles.com/magazines/ZNET/0041.txt. This is an old zmag text file of how to do it. I have personally performed the Peterson upgrade and found it to be very reliable as long as you keep your soldering puddles under control. It may get tedious at times unsoldering/resoldering so dont rush the effort. Take your time on each and every chip and follow instructions exactly as shown. Hope you find this useful.

Howdy Rick, folks

> Just as a for instance, you would want an XE adaptor *IF* you had a MIO.

I never had a MIO, but I ordered an XE adaptor way back when I needed
some cables for my 850. I now use it with my BlackBox. That way, I
have a flexible connection between by BlackBox and my XE. This makes it
easier to move the XE around a little without damaging the
traces/connector.

You have a very good argument. I have a Supra hard drive interface and do use it with an 800XL. An adaptor would just enable me to switch to an XE (if I wished). I just wondered if there was any around. Without damage they should last a very long time (unlike the peripherals that used it). Thanks Mike.

Hm... That looks very tempting, but appears to be somewhat risky. If I had another 130XE to just screw around with, I'd give it a whirl. When it gets to a point beyond the beta stage, I may try it.

For the time being, I may buy another one for expieremention. I found one in a used electronics/computer store about a week ago for 10 bucks. No cables, and in unknown condition. But for 10 bucks, it'd make a good donor machine at least.

Bill,
Congratulations. Between this and the games I see all the time on
the Knoppix discs with your name, I think I am going to have to request
an autograph. The game looks really cool. Great work with the
networking portion. I'll be attempting to get it to my phone here asap.
Thanks and keep us posted on your next creation,
Isaac Davis

Chaps,

I'm the proud owner of this on tape and as we all know, loading any game from tape isn't exactly a speedy process. To date, I've not found it available on floopy and suspect it was never made availsble for sale on disk (PLEASE enlighten me if you know differently and can tell me where I can buy it!!!)

So do any of you know ehere I could locate a copy of the file needed to play it via Atari800WinPlus? I can be damned if I can find it, and even the author Kevin Toms doesn't list it as available on his own website and he probably wrote the damn thing!!!

Please help, otherwise I'll be forced into running a ZX Sprecrum Emulator and that will never do!!

Rob

I think this was on ST. But you say you have a tape of it, I don't think
the ST had a tape drive. The author's site doesn't mention 8-bit Atari,
but it was for C=64. I've never seen it and can't find it in my archives.
There are some utilities to get the program from tape to a .cas file that
is usable with some emulators.

Agreed, indeed!

It is a pity, but this Mike Hohman disappeared without traces, it seems
...

We from ABBUC in Germany tried for years to locate this guy for getting
permission to keep the outstanding products from OSS/ICD alive. But
maybe he lost so much many on that, he will never show up again ...

In the meantime "everybody" around the globe re-produced and still
re-produces some of those products. Personally, I put MAC65, ACTION!,
BXE & BXL in one cart and provided this hack to others as well. You
might find it on the net together with digitized original manuals as
well as German translations of some stuff ...

>From Poland you can get re-engineered SpartaDOS X carts and Indus GT
drives (called CA 200X) which work as perfect as the original versions.

The risk to get sued - I consider it to be zero as long as there is no
big company envolved and you are doing it to keep the ATARI 8-bit scene
alive and kicking.
If someone might start to make big money out of it, he or she can get
shot ...

To all those who had successfully re-produced manuals and software:

Not only selling re-prints and copied disks or images but offering free
downloads might be more effective. Have a look at ABBUC InfoThek
(http://www.atari-portal.net/iframe.php?file=http://www.strotmann.de/twiki/bin/view/Infoth
ek/WebHome)
to get a glimpse of what I mean.

Register there and upload it for the community's sake.

It was available as you'll see from
http://www.vintagecomputer.co.uk/vcshop/scripts/prodView.asp?idProduct=3447.
I can only assume the author forgot he wrote it!! It's also likely it was a
UK only release. I've already tried creating a .cas file without success.
Thanks for the reply though.

Anybody else got any ideas at all?

Rob

I have an original copy of Football Manager on tape right here before me.
The manual says it's to be loaded with RUN "C:". You could try CLOAD and
save it back to disk, but I guess the program is somehow protected against
such a simple technique.

Or you could try to copy the cassette file from DOS (or any other file
transfer program) to disk. Under DOS use C C:,D1:
Afterwards you could probalby RUN D: it fom disk.

All this won't help, of course, if FM has a loader which then runs the game
itself.

If I have the time this coming weekend, I will try some other things
including various CAS to DISK copier or CSIMS, if nobody comes up with a
solution in the meantime.

Cheers,

Frank

Assuming it was a single boot tape, did you ever try the
utilities which might
convert it to a boot disk or possibly a bunary file? That could
be a step
toward transfer into an emulator.

WWW.Atarimania.com has Football Manager. The version they have has
been converted to a self-booting DOS ATR. This is unusual for
Atarimania who prefers CAS files and new DISK or ROM dumps (but I guess
they'll take anything if they don't alreay have it).

To run Football Manager on Atari800Win Plus first enable BASIC and then
load D1: with the Football Manager ATR and reboot.

It seems to work but I know nothing about UK football (soccer).

To get Football Manager go to www.atarimania.com, click on "8-bit",
search for football manager, and you will find it.

Enjoy.

I have a dozen Microtek AMB-32 boards, unpopulated, 32K memory
boards, which I could populate one and send you to test in the
Atari 800. I'm told they may not work without some kind of mod
but I am willing to load one with parts and let you have it to
try out. Then if it does work, you can buy the bare boards, or
I can populate them for you. I'll have to work up a price, but,
let's see if they work. I only have a 400 and 800XL, so that
makes it hard for me to test them. Let me know if this is ok
for you. Thanks.

Hi Bill

Thanks for your offering, but I'm looking for the modules produced by
Atari in the 80's.

It's good to know of alternate sources though, these boards are getting
scarce.

Near the bottom of the parts block list.

http://www.best-electronics-ca.com/800.htm

Might just be the cards without the casing,
but still, I always removed the casing for
the dissipation of heat anyway. Wish I had
an 800 to test these ram cards in. Difficult
to test things without the proper machine.

Hi Bill

> Might just be the cards without the casing,
> but still, I always removed the casing for
> the dissipation of heat anyway.

I've read that 800s had a 'freezing' problem because of the casing not allowing proper ventilation of the modules. My 800 came with the bare board modules, no casing. I'm looking for the ones with casing, because I feel those have the 'look and feel' of the 400/800 line. I don't like to see those bare boards into the 800...

> Wish I had an 800 to test these ram cards in.

What kind of mods have compatibility issues with the boards you build?

They aren't boards I build, they are boards I bought
accidently thinking they were something else entirely.
Now that I know what they are, I've asked around and
have been told there may be problems with these boards.
If and when I get a chance to build and test one, and
find that they don't work, the people I asked will tell
me what to do to them to possibly make them work.

Message-ID: <cd5bk11lls93m5sgeg6b3qb4dcc67ue8uh@4ax.com>
Source record: 9783

I am currently reproducing the ACTION! manual and about 33% done. It
will be available in PDF and print if people want to purchase a copy.
I just finished the OSS BASIC XL manual and is available for download
and purchase also.

Download:

http://www.8bitclassics.com/product_info.php?cPath=24_33_62&products_id=527

Purchase:

http://www.cafepress.com/8bitclassics

ACTION! should be done in couple weeks hopefully, and after that will
be probably Mac/65, then BASIC XE. I will also be adding the Toolkit
text to the ACTION! manual.

If any questions, please feel free to reply here or preferably shoot
me an email at corey@8bitclassics.com.

Thanks,

Corey

> ...You have a very good argument. I have a Supra hard drive interface and do use it with an 800XL. An adaptor would just enable me to switch to an XE (if I wished). I just wondered if there was any around. <

Just out of curiosity, what hard size/drive(s) do you use with your Supra interface? Do you use a Bridge Board (SCSI adapter) or an imbedded SCSI drive, and did you get an original Supra or a later Klaas version?

I looked (briefly) at making/selling a new cart expander + adapter. No problem making 1 or 2 hand-made prototypes, but to get commercial quality boards, etc, it was several hundred dollars for a couple of prototypes + then a minimum run of several hundred units to get commercial quantities to sell. I would estimate that 100 would be a "lifetime supply." To say the least, the economics look unfavorable. But perhaps could be done less expensively elsewhere. -Larry

I see one for $19.95, which I guess is the cart and some documentation.
Then there's just the cart for $9.95. There may be a minimum puchase
and sure there is ship and handle.

Ah, that's why I couldn't find it either. Thanks for the de-restriction.

Mind you, with red and grey text on a black background, on a 1280x1024
screen, it can be hard to read at times.

Hello All,

I am clearing an overstock of Atari to RCA (phono) 2m (6.5ft.) gold-plated mono TV cables, with prices starting at US$2.50 including shipping to any country. These plug in to the Atari's monitor socket, and deliver far superior video and audio quality than the standard RF modulator. All you need is a TV (or monitor) with RCA inputs (virtually all TV sets, even the cheap ones, should have at least one set of these).

Full details, with PayPal order buttons (you can pay directly from your PayPal account if you prefer) can be found on the website. This offer is only for readers of comp.sys.atari.8bit, so go directly to the offer page at:

Hmmm looking over his message, he says pricing starting at $2.50...it may be
a quantity discount.

I can work around it by upping the font size temporarily. It's just that
I often forget to drop it back.

Memory like a, err, you know, thing with holes in.....

I said 'starting' from US$2.50. If you buy a pack of three, the price is $7.50, which makes them $2.50 each. There is a base shipping cost with the Royal Mail, which means it costs the same to ship 10 grams as 100 grams. That's why buying a single cable costs more (per cable) than buying three. Once you've gone past the base charge, the cost per extra 100 grams is a lot less. That's why shipping more costs less per cable.

3697. Retroputing Forums/Particles! BBS

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-09 23:12:08 UTC
From: Brian Green <icenospace@particlesnospamdot.org>
Message-ID: <BF6F0DF8.3686%icenospace@particlesnospamdot.org>
Source record: 9804

Particles! BBS has been online, more or less, since 1992. We feature:

- USENET and DoveNet
- 10000's of Classic Gaming Files (C64, Apple II, Amiga and many more)
- Active online games, LORD, TW, and much, much more.

The BBS is online 24/7 though down when we have the big thunderstorms come through the area :)

Check us out at:

telnet://particlesbbs.dyndns.org

Or you can visit via Java telnet program on the main website.

Retroputing:

The forums are dedicated towards the discussion of older computers, ie, "retroputing". Though there are many sites dedicated towards conversations and information sharing on the topic of classic gaming consoles, there didn't appear to be much in the way of forums of all old computers - normally sites are dedicated to a single system. I'm hoping to change that and create a bit of a community for all fans of older computers. Hopefully you'll check it out. Thanks for your time!

Brian

Yes, I've heard :). Look at this link: http://pasiu.krap.pl/ ... My brother (Pasiu/SSG - author of the Project F7 accelerator) has announced that this card will be released on spring next year.

http://pasiu.krap.pl is in Polish language only - English version will be soon, I hope ;)...

3702. ATASCII Animation from A.N.A.L.O.G.

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-11 00:06:36 UTC
From: OmicronDelta <david_corey_whyte@hotmail.com>
Message-ID: <1128989196.959079.18710@g43g2000cwa.googlegroups.com>
Source record: 9809

Anyone remember a type in from A.N.A.L.O.G. called ATASCII Animation?
I used this program quite a bit in my youth, but Cyberroach's site is a
little limited (not one A.N.A.L.O.G. I owned is on his site).

I've tried looking for it on various ftp's and sites but to no avail.

The reason I'm asking is beacause I'm porting some of my favorite basic
apps from mags to Action!

Another program from A.N.A.L.O.G. that I'm looking for is a calender
type program. All I remember is, is that I used it lots, had green
screen with overlaying menus and input dialogs.... I think it was in
the same mag as the V: handler..

Can anyone help me out?

No prob, if anybody can think of something else that would be useful, let me know. Preferably via email.

Started moving again on the ACTION! manual, try and get that done soon. Just busy with everything. I am hoping to retain some of it so I can maybe make a game with it. Same goes with the Mac/65 manual :)

Anyway, glad it is coming to some use. Been downloaded a few times and did post it up on AtariAge.

Thanks. I was hoping for some hands on expereince with someone in the group,
and how it compares to the atari win plus 4.0 or atari++.

I will have to give it a try. I've also heard rave reviews regarding the c64
emu on the pocket pc. Playing Pirates would be great on pocket pc using the
pocket 64.

Looking forward to trying star raiders on the pocket atari, and also
Interstel's Star Fleet II..

Finally!

I finally managed to scrounge a TV tuner/video input card for my Performa 5200. What does this mean? It means that I now have a monitor for my trusty old Atari 800XL! As a matter of fact, I have my Atari 800XL hooked up to the 'video in' port on the back of my Performa as I type this.

It's really quite clear! I'm amazed! I wrote a rinky-dink little Basic program (five or six lines - nothing special) just to get an idea of the image clarity of this card. Ya know what? It looks pretty damn good! Of course, I have to reach over and press the space bar every once in a while because attract mode kicks in.

Heck, it's been so long since I've actually done anything with the old boy that I'm thoroughly surprised that I remembered to poke 752,1 to hide the cursor! Looks like I'm gonna have to break out the old 1050 floppy drive and the 300 or so 5.25" floppy disks that i have kicking around. Yeah!

Oh yeah, and I finally managed to get BSD installed on my Quadra 700. I'm thinking about doing a BSD install on an LC III and putting it online. Why? For people to hack! Come try to hack into my LC III running NetBSD 2.0!!!

I'll keep ya posted...

Regards,

William

I read that the demos were made with the "slow" version of the accelerator. The faster version was to have a cache to further enhance performance. I don't know which the final version will be, but either way, it will be a tremendous accomplishment.

Now all we need is a good 80-column adapter, and we'll be ready for the big leagues! ;-) -Larry

Here are some HIP screenshots (presumably from an emulator) of A8JDPEG,
an Atari 8-bit JPEG decoder/viewer:

http://www.myatari.net/issues/may2001/jinks.htm

I spent a coupla minutes Googling, but it's hard to come up with good
links quickly. Good luck! :)

Nice find. It should be noted that HIP looks much better on a real
television that it does in the emulator screen shots.

I know I know! I found alot of dead links and more info... too bad I dont have a SIO2PC for my 65xe yet or I would try some of the demo's out myself. Just wanted to get an idea how it looked. Judging from the pics you linked too I would say not too good, but then emulators never look as good as the real thing...

I'm looking for some more 1200XL computers. If you have any for sale
please drop me an e-mail.

They dont need to work and non-functional (but physically intact)
keyboards are ok. They just need to be intact, no missing internal parts,
no missing/broken off keycaps, no missing plastics or chrome parts.

Thanks

Have you seen these?
http://www.angelfire.com/80s/rjespino/8bit/a8jdpeg/gallery.html

There are several HIP images there, they're good enough to easily
recognise the people in the photos (if you know who they are of course
;).

The quality varies with the image used, images with a lot of small
details don't come out as well, portraits and Anime style images tend
to work better.

I have the RAM and ROM modules for the Atari 400 computer. They're nothing special, just the stock Atari units that shipped with the 400s. If you're a bird, you can have them for a song. Barring that, you can make me an offer.

Regards,

William Reynolds

ps. My last name isn't really Reynolds. I just typed that because I'm a born liar... Not!

Don't have any Mac/65 manuals yet except the one I found on the net
which I will be replacing. If you would like to make a copy, that
would be great!

Will do the same then for the Mac/65, add the toolkit manual as part
of the original manual.

What I will do is make some high quality scans turn them into jpegs and put
them on my website. I should have it done before end of month and will post
the links here.

You gotta be pretty lazy to auction off your entire collection with just
one photograph taken from a distance. You can't even see anything except
for ~ 5 pieces of equipment.
At least take a few pics from inside the locker. The guy obviously
doesn't care about getting market value for his items, as this auction
raises a big ol' red flag.
My prediction of final selling price: $112

Anyone else wanna make a guess?

I agree with the other posters, your brother needs more pictures to back up the descriptions, also pics of the misc cables, books and stuff.

(I'm glad my storage isn't that piled up... Though it is getting there...)

Larry

This is my collection. I would be willing to bet that none of you have ever had to acquire, store, pay for, protect and maintain a collection this large for five years. Looking at the picture do you believe that I have instant access to prime pieces to photograph them? Don't you already know what they all look like anyway? Do you think I am lying? Anybody can get pictures from somewhere else and claim that they are their machines. If I was to post a couple of pictures of Macintoshes and cables and would you feel better? I can't take pictures inside the locker because I can't get into the locker. It's too full! And it doesn't make sense for me to start ripping packages open (as you would know if you read the whole eBay description) because as they sit now they are protected. It is just not feasible (due to the fact the stuff stacked almost ten feet high ten feet deep, the primary purpose of the photograph which is also explained in the description) to start tearing the place apart looking for a needle in a haystack. As the description says I am not selling anything super rare. If you know anything at all about vintage computers you should be very familiar with what I have listed and shouldn't need to see a picture, if you do there is plenty of that kind of stuff on the Internet. If you want to come see it in person by all means I will show it to you. I am protecting these computers as best I can. As the collection grew I was forced to rent a storage locker, as I was not considering selling the collection I did not take into account that I should pack it in any other manner other than the most space efficient and protective. Considering the circumstances this is the best I can do. It's easy to be critical. If you have the practical experience and you could do better by all means let me know.

S :-)

The problem is, we have to take your word for it. What I see in the picture is a big pile of boxes and plastic bags. I see in Apple II wedged in next to the bicycle, and I think I can see two Apple II era monitors. We all know what it takes to store such items, but when it comes to buying something we need some assurances. This is clearly a huge pile of stuff, but I see nothing in the picture I want to own. Furthermore, you make no assurances regarding physical condition, or if any of it actually works. You even admit in the description that you don't know everything that you have stuffed in there.

You probably will not get a bid anywhere near the market value of all this stuff, because your buyers cannot get a clear idea of what you have for sale. Besides, if you really want to get top dollar for this, break it up into bundles. Hell, you could probably get enough for the Apple II and the two monitors (assuming they work and you clean them up real nice) by themselves to pay for another month's rent on the storage unit, which would in turn allow you to dig into the first layer of boxes and put together a few more bundles. It's a huge job, but I think you'd be happy with the extra cash. That is, unless everything is in such bad condition (or simply non-working) that such close scrutiny by your bidders would be counter productive.

Dude, most of us here are just trying to be helpful, sure it's critisim
but no one here (except for one poster) thinks your auction is bogus.
Just that we could see you could do better if you had a better
presentation is all.

I wish you luck on the auction, certainly it's a lot of cool stuff you
have listed.

Sure I know what most of the items you list in your auction look like,
but without pictures how can I know what condition they are in? I
would pay alot for mint condition Atari 800xl's and Apple II's but
hardly anything if they are in poor condition.

Surely bidders are going to consider the "Sight Unseen" factor,
and the "work involved" factor as well, but, the "what-if" part
is intriguing, even to me, but I'm in PA so this is out of the
question for me entirely anyway. Had I been in the local area and
possess the space to store this stuff, I'd consider bidding and
should the list even remotely describe what "is" there, it truly
could be the Gold Mine that is being offered. The person who is
auctioning off this stuff, however, is inveritibly, "The Loser".
Broken down and sold in separate lots surely would bring loads
of cash, but this way, it is just a garage sale at best. :o)

As a collector (of a quite a large amount of vintage computers and game systems) I think its 'BLASPHEMY' to treat your collection like this and just stack and pile it to the ceiling with no rhyme or reason!

One has no respect at all if they treat their prized collection like this.

Still would be cool to go through... feel sorry for whats on the bottom though (sigh)

I wish I had that much money where I could just not care and sell everything in one huge pile on eBay. People don't realise if took the type and tested and took photos of everything that one could make a killing on eBay instead of a bulk deal for stuff.

I will cherish that photo though thats funny but sad give the collection to me... I will air it out and add it my 'shrine' of gaming.

I was a compulsive hoarder, I bought most everything I came into
contact with thinking it was going to be valuable/needed/useful
someday. I (foolishly) envisioned that I could save this stuff until I
retired and then it would be the basis for a hobby. I rarely if ever
tested what I bought; I figured I would do that as my hobby. If
something didn't work I would (and do) have multiple examples from
which I could get parts. I assume most of the stuff I bought worked; I
have no reason to believe it doesn't. I assume some of the stuff has
problems. The collection is obviously being sold as is, like I said if
something doesn't work there is a good chance there is another
example that does. There is a reason I am selling it the way I am, I do
not have the time or the resources to break the collection down and
sell it bit by bit over eBay - THERE IS TOO MUCH! If I don't get a
reasonable offer I will donate the majority for a tax write-off and
keep only the cream of the crop. A lot of people seem to be taking this
personally. Don't, it doesn't involve you. This auction is not for
everyone. It takes a large commitment (I pay $100 dollars a month to
store it) and most people will not be in a position to handle it. As
far as having to take my word for it, I imagine you've noticed
that's how eBay works; a lot of it is on faith. Once again (If you
read the full description) you'll notice I referenced my feedback
(much of it gained from buying stuff in the collection), it is
impeccable. Tomorrow I will go out there and rip some packages open and
take some pictures, I don't think this is really going to give much
insight into the vast majority of the collection, but it's what the
people want. Please know that I do appreciate the constructive
criticism, it's the ignorant blowhards I could do without.

Um, does this mean you plan to renig on your auction if you don't like the
final price? You did not set a reserve.

I am not legally obligated to give away for next to nothing something I
have thousands of dollars and years of effort sunk into. If I was to
end my auction early (emphasis on my, it's meant to serve my purposes,
I'm the paying customer), I would be well within eBays rules
(http://pages.ebay.com/help/sell/policies.html). They are only
concerned with "Chronically" ending items early. If I were to do
it, it would be the first time ever. S:-)

3755. Riddle of 8-bit ASCII's

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-16 04:49:14 UTC
From: nickb@eris.io.com
Message-ID: <8_KdnV7ZN-NXRszeRVn-gg@io.com>
Source record: 9712
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit

I grew up initially with several computers in the Atari 8-bit series.
After my 130XE died, I got my grandfather's Commodore 64. They had
one thing in common: wacky dissociation between screen memory and
their OS's idea of ASCII.

With both computers, you could display letters on the screen with a
POKE to video memory. However, the number you POKEd was almost never
the same number you would put into a CHR$ function to print that
character.

For example, to get an uppercase A, you would:
(a) PRINT CHR$(65) (assuming uppercase mode if C64)
(b) POKE 1024,1 (Commodore 64)
(c) POKE 40000,33 (48k Atari 8-bit)

Is there any reason the screen memory was set up this way? Why wouldn't all three be 65?

Also, what's the deal with the backspace? In PETSCII, it's CHR$(20),
even though CHR$(8) is right there doing nothing. In ATASCII, it's
CHR$(126). I understand that ATASCII puts graphics tiles in its
first 27 characters, so it can't use CHR$(8) for backspace or
CHR$(13) for CR. But ASCII DEL, at CHR$(127), is RIGHT NEXT DOOR,
but ATASCII puts the tab there instead.

There's one peculiarity that's specific to the Commodore 64. It
seems that PETSCII allocates graphics characters nearly at random.
For example, the ASCII values of C=A, C=B and C=C are 176, 191 and
118, respectively. The color control codes are even more haphazard.
If I ever want to use the CHR$ function or a hex number to specify
one of those graphics characters, you pretty much have to look it
up every time. Is there a pattern I'm not seeing?

I wonder if there's any hidden wisdom behind these decisions.

Heh. Try the Apple][(where, thankfully, it's much simpler)...

```
]? chr$(65)
A

]poke 1024,193

]
```

At least it's as easy as adding a 128 on the Apple.

Thankfully on the Apple it's 127. (8 is Left Arrow, which made keyboard handling a nightmare in the original Dapple. 9 is of course Tab. Apple used ASCII quite straightforwardly in their computers, thank God.)

This is directly from eBay seller policies.

Ending Your Listing Early

Sometimes something goes wrong and you can't complete your listing as planned. If needed, you can choose to end your listing before the scheduled date. If there are bids on your item, you can cancel them.

Reasons for ending listings early include:
Note: Your account will still be charged listing fees (such as the Insertion Fee) if you end your listing early. Consider revising your listing first if there are aspects of it you want to change or improve.

a.. The item is no longer available for sale.
b.. There was an error in the starting price or reserve amount.
c.. There was an error in the listing.
d.. The item was lost or broken.
Timing Matters
When there are 12 hours or fewer remaining and the item has a winning bid, including a reserve met bid, sellers may not make any changes to the listing, including:
a.. ending the item early. Sellers may cancel bids, but not end the item unless the item is being sold to the high bidder
b.. adding to or changing the item description
c.. converting the item to pre-approved bidder
Canceling bids or making changes to a listing with bids when there are 12 hours or fewer remaining damages the buyer experience and can undermine trust in the marketplace.
To end your listing early, follow these steps:

1.. Type your item number into the End My Listing Early form. (You can get this number on your listing, on your confirmation email, or on your My eBay page.)
2.. If there are bids on your item, choose between:
a. Cancel bids and end listing early
or
b. Sell item to high bidder(s) and end listing early
If your item has no bids, you'll skip this step.
3.. Choose the reason you're ending your listing early.
4.. Now your listing will end and will no longer be displayed on eBay. If there were bidders, they will be emailed that their bid was canceled and the listing ended early.
Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are

legitimate reasons for ending a listing early, abuse of this option will be investigated.

Not according to what you posted:

/Note: Sellers are not permitted to cancel bids and end listings early in
order to avoid selling an item that did not meet the desired sale price.
This is considered to be reserve fee circumvention. Although there are
legitimate reasons for ending a listing early, abuse of this option will be
investigated./

That means that since the seller indicated in this thread that they
intend to end the auction early if they do not receive a "worthy" bid,
which implicitly is a circumvention of the reserve fee, thus an abuse of
the end-early option.

Actually, if you don't set a Reserve Price and you don't end the auction
early, you ARE legally obligated
to sell to the highest bidder. Just as making a bid constitutes a contract,
so does offering an item for sale.
If I were you, I'd end the auction early and re-list with a Reserve Price.
As it stands, if the winner of the current auction wanted to take the case
to court, you'd be on very shaky legal ground.

> I wonder if there's any hidden wisdom behind these decisions.

Yes, the wisdom is called 'copyright'. People were making a career out of sueing each other over copyright infringements in those days. So lots of companies did it a little different.

These days we have a thing called 'software patent', which leads to exactly the same thing.

Except that the lawsuits are a lot more expensive.

I wish I chose to be a lawyer. Nothing better to make money off than two people fighting each other.

>all three be 65?
>

I imagine that it's because a value read from screen memory is used
directly by the hardware as an index into the table that contains
character shape definitions. The ASCII charcter set may not be the
best choice for this--for one, you need to deal with all those non-
printing characters. Such complexity may have added unacceptably to
the cost of the hardware, while doing translation on software was
essentially free.

>Also, what's the deal with the backspace?

Well, remember that even "real" computers couldn't get DEL and BS
straight!

Read, it says "DESIRED SALE PRICE" and "RESERVE FEE CIRCUMVENTION".
This applies to auctions with a reserve fee set. He has none set.

> That means that since the seller indicated in this thread that they intend
> to end the auction early if they do not receive a "worthy" bid, which

Here you eat your own words, where you repeat the same terms,
"CIRCUMVENTION", and "RESERVE FEE".

He may end his auction at any time before the 12 hour to end limit.
You pulled your data out of context, and I've been a seller on eBay
for quite a while, so read up.

3768. Re: [OT?] Question about Linux AtariSIO

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-16 11:25:06 UTC
From: David Bowden <nospam@spamsux.org>
Message-ID: <M-WdnZF-lPgTpc_enZ2dnUVZ_s6dnZ2d@comcast.com>
Source record: 9725

You know, this has been one hell of a learning experience for me... All the nonsense I fought with was 100% due to my complete lack of experience with Linux. Allow me to explain...

I had all but given up on ever using my Linux server to host files for my trusty old 8-bit, and I would have never figured out what was going on were it not for Doom 3.

A buddy of mine finally talked me into getting Doom 3 as he and all my other friends have been playing it for quite some time. I played it online a few times and decided my buddies and I needed a server of our own not full of guys with "1337 mad skillz", and I had the perfect platform and connection to do it with. So I downloaded and installed the Doom 3 Linux binaries and set up the server. Worked great. Then I decided I wanted to actually try to play the game on the Linux machine just to see what it's performance was like.

Well, Doom 3 needed the newest nVidia driver and I never installed one, it was still using the generic one that came with the distribution. So I download the driver installer and it said there wasn't a precompiled driver available for my kernel and it tried to build one for it. That was where things got stupid.

It found my kernel source headers, but kept refusing to compile it, but wouldn't give me a good reason why. I dug around for 4 hours trying to find the problem, checked all the logs, and found nothing. I went back to check my kernel source and it was there, just fine (or so I thought). "uname -r" returned "2.6.11-6mdk", but my headers were "2.6-2.6.11-12mdk" (what the Hell does that mean anyways?!)!

I discovered that "urpmi" kept fetching the "12mdk" instead of the "6mdk". I have no idea why it did this, but, in the end, rpmdrake got the "6mdk" I needed.

The driver compiled nicely and I was in business (after I fixed the minor disaster I caused to the X server...), away I went fragging demons using penguin power.

Couple of minutes into the game, I had an epiphany. Closed down my game and tried to compile and install atariserver again, and this time it worked FLAWLESSLY.

I really want to thank Matthias for his patience in dealing with my stupidity, and I'm loving AtariSIO so far. :)

Thanks again guys,

3769. LARGEST HOME COMPUTER COLLECTION IN THE WORLD (?) FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-16 12:04:31 UTC
From: "Dimitri Kokken (info@fki.be)" <dimitri.kokken@pandora.be>
Message-ID: <tkr4f.186117$HN5.73347@biebel.telenet-ops.be>
Source record: 9726

Hi there,

I am selling my complete collection of computers (over 570 different ones).
If you are interested in some computer(s) from my collection, just mail me
at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you to
the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS MESSAGE
PLEASE!

In max. 2 weeks time I will start a mailing list and everyone will be able
to bid on SEPARATE computers.The exact procedure of the sale will then also
be explained

So...please don't mail me saying : I am interested in X and I want to know
how much you want for it as I don't have prices set.

As you can see from my 100% positive feedback on Ebay (member ChaosDM)
this is not a scam, but a serious sale. I don't want to go through Ebay
directly, because listing 570 different items
separately would take AGES!

Anyway...the list of the collection can be seen here :
http://users.pandora.be/F-242/Computers.htm

There are a LOT of very and ULTRA rare items in there

For example :

A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
A LOT OF ARABIC MSx's
A LOT OF RUSSIAN COMPUTERS
ETC...

Cheers,
Dimitri Kokken
Belgium

On the TI-99/4A, you add 96 (>60). This is called the BASIC offset, and
is used to maximize VDP memory for your program. (The beginning of the
character pattern table overlays another area).

So:

```
>PRINT CHR$(65)
A
>CALL POKEV(0,161) ! place A at screen location 0 (and POKEV requires E/A or Minimem or an
enhanced XB)
```

As far as backspace, the "left arrow" key is 8, and you can hit FCTN-V
for 127. Or you can change the keyboard to PASCAL mode (mode 4) and
then Ctrl-H is 8, and 127 is still FCTN-V.

But as far as ASCII goes, outside of the BASIC offset, it is quite
straightforward. Except that on the TI control characters don't get
translated (meaning control characters in files are read just as they
are, don't do strange things, control characters printed to the screen
don't cause screen clears, beeps, or anything else - they just show
whatever the character definition for that character).

I too have been a seller on eBay for quite a while, and I feel my
interpretation is correct. The term "reserve fee circumvention" means
he did not use a reserve, thus circumventing the reserve fee that eBay
charges. The policy stated is their to protect eBay's fee structure,
not the seller nor the buyer.

Please read ALL of the policies on ending early, not just
the areas you need to argue with me. It says, should the
seller end early, the eBay listing fees will still apply.

'Nuff said, say n'more, nudge-nudge, know what I mean?

End of discussion, because I know what I'm talking about.

I'm intrigued as well and in Philadelphia. Maybe we should make a drive?
I definitely do NOT have the space right now, but I plan to buy a house
within a year which will have a suitable basement for this pile ;) I
worry about renting a truck and getting there and it just being completely
worthless junk. I think we all know some collections are like magic,
others are a pile of half broken 520ST's. I'd pay more for a single
clean falcon than 15 dirty 520's. That's why the contents matters to me,
and while this is intriguing enough to look at, I won't make the drive on
that description alone.

Thanks,
Mark

Doh!

Nevermind, the collection is in Portland. I thought Massachusetts for
some reason. My ownership of this collection is now completely out of the
question ;)

Thanks,
Mark

This is the correct interpretation- if you end your auction early by
cancelling all the bids and ending it, you essentially created a reserve
auction without paying for it. That is what eBay doesn't want because
it damages the marketplace. Nobody will bid on things if they knew the
carpet will just be pulled out if it looks like they are going to get a
good deal.

If you want more money for your good, then set the reserve, or else just
set the minimum bid amount for the least amount you would take for it.
If you put it up for a dollar and later pull the auction, you are a
jerk and I would report you if you did it.

Ebay has a lot of screwed up rules that they continue to use that make
no sense, and really this is still actually too easy to do- you should
not be able to end your auction *at all* in my opinion.

Pete

I'm not arguing with you. It says you can end any auction
outside the 12 hour limit, by choosing one of 4 options
for doing so, but you still pay the listing fees for the
auction type you chose. Difference is with a reserve price,
if it ends naturally you can still choose NOT to sell to
any of the bidders. Now go away. Thank you.

What was discussed here is clearly mentioned in the rules as "Reserve Fee Circumvention" and is a reason to report the seller. I don't understand how it could be more clear.

http://pages.ebay.com/help/policies/listing-circumventing.html

It actually calls it "Reserve Fee Avoidance", not Circumvention, but
same thing.

-snip-

Reserve Fee Avoidance - Canceling bids and ending a listing early
because the seller's desired price has not been met.

-snip-

Hey loser, listen closely.

If I set up an auction, I can decide not to have a "reserve". This saves me some money, as adding a reserve costs me a little more to list.

So I list with no reserve. However, I'd quite like to get about £100 for this item. With one hour to go, the bidding is at £50 and has been static for a while. I'm not going to get what I had hoped for this item.

So I cancel the auction.

This is exactly what would happen if I *had* set a reserve, but because I did not set one then Ebay loses out on that small amount of extra cash they would have charged me. This way, I get an auction that works the same way as a reserve, but without paying.

Ebay doesn't like that, so it's against the rules.

Oh, I forgot to add five exclamation marks, but I think you get the point.

D.

You argued your own point, so clearly you don't understand the whole concept of this at all. He didn't pay the reserve fee, so he IS "avoiding" it. You pay an extra reserve fee when you list your item, so it's a little more expensive to do so. If you end your auction early because you don't like what it's selling for (which is a selling offense you can be reported for) then you just created a situation that has the same outcome as the reserve auction, BUT YOU DIDN'T PAY THE FEE!

Pete

YOU don't get it. You have to end outside of a 12 hour limit.
There is no ending any auction within this 12 hour time-frame.
Read the whole thing, not just the part you want to argue with
me about.

Bill Garber

Yes I agree 100% this guy is playing around a bit with the rules and
he admits he doesnt even know what stuff works and what doesnt, it's
probably mostly in pretty poor shape, and even if you won the auction
would you trust this guy not to take the best stuff out before you
came to pick it up? I know I wouldnt.

I dont think he is gonna have much luck.

Haha. Read this again, slowly. You should stop, Bill. You're not only
showing that you don't understand eBay rules, you're starting to look like
an idiot, too.

The last 12 hours has NOTHING to do with this discussion. You can't end
an auction for the reason this whole thread is about, last 12 hours or not.

Again, from their Policies:

"Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are legitimate reasons for ending a listing early, abuse of this option will be investigated."

I mean, damn. What is your eBay user id?

The fact is that one of the options is "The item is no longer for sale".
This is broad enough to cover 'because the seller fears they will not
get what they wanted for it'.
A seller can decide to not sell their item FOR ANY REASON. Therefore, if
they decide the item is no longer for sale because they fear it will not
fetch an amount they want, then that is their right (as long as it's not
12hrs before the end).

nickb@eris.io.com (Nick Bensema):

>I wonder if there's any hidden wisdom behind these decisions.

At least on the Atari, I seem to recall it had to do with the fact that in some graphics modes (gr.1, gr.2) you could display text in color. The color was based on the most significant bits of the character screen code. You could do something like:

```
print #6, "UPPERCASE"
print #6, "lowercase"
print #6, "INVERSE UPPERCASE"
print #6, "inverse lowercase"
```

and get different colors for each line of text. This dictated the layout of the character sets to a large degree.

I doubt it had anything to do with intellectual property rights in any way.

That particular reason is expressly forbidden by the eBay policy. I also think that its highly dishonest, no matter what kind of auction you are running.

Personally, I would never do it.

Perhaps it's better, if you are contemplating ending an auction early for dishonest reasons such as not getting enough money for the items, that you don't post about it on public newsgroups first.

What about if your dog pisses on the item after it's listed? How about
if you legitimately lose the item (some people are really that
disorganized).

Thanks. And I know I'm right, and I believe they are mostly not
sellers, but buyers who have been screwed over by this very policy
and simply don't like it. :o)

You don't know what you're talking about. At Pete posted earlier, ebay's
policies specifically forbid ending an auction early because it isn't
reaching the price expected. That's why they have reserve pricing.

Whether you can lie and end the auction for some other, bogus reason is
beside the point. Please tell us your ebay id so we can all never buy
anything from you.

Don't buy anything from any of these crooks. Bill post your ebay ID so we know who to avoid.

My philosophy on Ebay is that I love getting good deals, and if someone gets a good deal from me, I love giving good deals, too.

I have gotten some REAL great deals off Ebay, no doubt about it, and I was really happy about it. And I know that when someone gets a good deal from me that it is really making thier day, and that makes me kinda happy as well to be able to provide that experience to someone.

Somebody who is only concerned with what they can get out of the deal and not concerned at all about the time and effort of thier customers is not someone I want to deal with: there are plenty of ebay sellers who follow through no matter what - it is the sellers who need customers, NOT the other way around. I'd have more respect for these guys if they'd just decide how much they want and put a "buy it now" up on it, or put in in an ebay store.

I did - that's why I decided you would benefit from being corrected. Arguing with you doesn't come into it - others are doing that, and making a far bigger fool of you than I would be inclined to.

Is your opinion of yourself so great that you feel the need to call everyone who disagrees with you "losers"? And when someone responds in kind, then the rules change for them but not for you?

Very poor.

D.

I have to agree with Dr. Smith here, (believe it or not), but he's dead
on (IMHO).

If you want $X.XX for it, than set a reserve. If you simply end it
early because you aren't happy with the price, then you are dishonest
and should be avoided.

It's against the rules... Period... It's fraud. The principle of the auction system is the gamble. The seller makes a gamble on the final price. That's the fun of it. That's WHY ebay is popular!!! And it's CLEARLY against their rules. You can end an auction early because your dog pissed on the item or because you shot at it with a 9mm in a drunken fit of rage... not because you don't like the way the $$$ are going.

Give it up...

Mark

I notice a lot of people don't like Reserve auctions.... I seen pinball machines end at $150 with Reserve that you know are worth $600+ people just kinda blow them off. I certainly would be scared starting at $9.99 though (laughs).

I always start my auctions with bottom line of what I would like to get at least what I paid for it.

And always try to be reasonable on shipping too... and I 'clean' everything!

The 'biggest' thing though is I take the time to take photos and be honest with condition... that dude could make a killing if he took a couple weeks off work and sorted through everything, clean it up and test it all.

Hmm let's see... make $200 on it (he will end it early for sure) or make $2000 on it by putting some effort into it.

I dunno I kinda like making money (shrugs)

Oh ok sure... oh, wait... maybe not.

One of the legitimate reasons for ending an auction is "The item is no longer for sale". The reason it is no longer for sale can be anything, INCLUDING the possibility that it may not reach the seller's desired target sale price. If I wanted to I could end an auction early because I stubbed my toe, or wasted time explaining something to a dufus on usenet. That is the key here... a seller can decide that an item is no longer for sale FOR ANY REASON (as long as it's not in the last 12 hr window).

not necessarily, you dont know the condition of the computers (Im
guessing they arent in the best shape judging by how they are stored)
by his own admission he's never tried most (if not all) of them, so
many of t hem are prob just garbage and virtually worthless. Also it
sound's like if you get a good deal he will prob take the best ones
and keep them for himself (or sell/donate them elsewhere) and leave
you with the junk.

It's definetly a gamble bidding on this auction.

> FIRST PLACE!!!!!

As others have noted, It's called a "Reserve Fee Avoidance" violation because the seller did not set a reserve (and thus did not pay the extra fee), but ended up treating the auction like a reserve auction. I see where it can be misunderstood to only apply if he was running a reserve auction, but it applies to non-reserve auctions. There is no need to end an auction early for reserve auctions, because either the price is met, or it is not. (Well, there is, if you state you are listing the item locally, and it sells before the uaction ends, but you wouldn't end the auction because you did not get the price you wanted, because that's the definition of a reserve price)

> YOU don't get it. You have to end outside of a 12 hour limit.
> There is no ending any auction within this 12 hour time-frame.
> Read the whole thing, not just the part you want to argue with
> me about.

I read the whole thing....

Actually, you CAN end the auction within the 12 hour mark. You can technically end the auction 1 second before the deadline. You just can't do it chronically.

Nonetheless, there is a huge difference between what eBay rules allow and being a good seller.

The seller has already note that if he does not get a "fair" price for the non-reserve auction, he will end it early. Technically, eBay will let him do it, unless someone complains to them about the auction.

I see a problem with the rules in this area, as the first mention of the rule states it can never be done, but right below, it gives the seller 11 times to do without incurring any investigation. It's hard to know which is correct. In any case, given how popular eBay is and the fact I see infractions committed on listings all the time, I'd say the seller will have no issues from eBay.

That said, I think the seller is acting in bad faith. Regardless of the rules of eBay, no one wants to bid on a non-reserve auction, only to see it cancelled at the last minute.

Do you believe the seller is acting in good faith by noting he will yank
the auction if he doesn't get a certain amount? It seems strange to so
actively defend the original sellers abuse of the eBay rules, as they
are written.

One thing to keep in mind is that, even though we now know that the C64 massively outsold any previous CBM computer, when it was first introduced CBM would have been re-using what they had done before, and would have wanted as much portability of Basic programs as possible between different CBM computers.

Its normal for "early entries" into a market to do things in an idiosyncratic and slightly cumbersome way ... after all, its experience WITH their products that teaches us where the "rough edges" are. PETSCII and going to upper/lower case by swapping the case of ASCII upper case characters is a case in point. It obviously was not as big a deal as a "rough edge" as the horrible keyboard on the IMB PC Junior, which died a well-deserved early death.

When the early CBM computers were designed, a "soft terminal" that worked similar to a VT52 was handy, and the VT52 did not handle Backspace/Delete the same way as the (later) IMB PC.

You can run into similar issues today when porting character programs from Win/DOS to run in the "linux" term in Linux.

I visit this group from time to time, so I apologize
if I'm seeing this message a little late.

It's been a _long_ time since I've reviewed the document
covering the sale of Mac/65 to ICD in the 1980's; it
would take a little digging to find it (I have a hunch
that it's the only surviving document of the sale).
What I sold to ICD was a _version_ of Mac/65 and its
name. I still retained the right to develop an assembler
for the Atari 6502 based computers (or any Atari computer,
or any computer based on any CPU), even using the same
code base. I could not call it Mac/65 or associate it
with ICD's Mac/65, etc. As I recall, ICD's focus was on
the name Mac/65 with the code base IP a secondary
consideration, and it was agreed that changes to the
code base yielded a product that was _not_ Mac/65.
An unusual and simple agreement (by today's standards),
but that's pretty much how it went down.
```

At the time, with the introduction of the Atari ST series,
we wanted to put all of our resources into the new products;
ICD seemed like a good new home for the 8-bit series.
At the time, none of us thought that the life of the products
would be so long!

Again, I may be fuzzy on the finer details, but there
were three of us independently negotiating with ICD:
myself for Mac/65, Bill Wilkinson (et. al.) for the
Basic's XL and XE, etc., and the author of Action!
I do not remember where or how Jim Dunion (author of DDT)
fit into this at the time. I don't remember if OSS
owned DDT outright, or was licensing it from Jim.

ICD wanted all of the products or none of the products,
so if any party was reluctant to sell, that would have
stopped the purchase of the other products. Sadly, we've
all lost touch with each other, and I haven't spoke with
Bill Wilkinson in well over a decade. The last I heard
was that he was living in Washington state.

I have not released any version of Mac/65 into the Public Domain.

Having said that, I don't really know which _versions_
of Mac/65 are actually out there. However, I ask that
any Copyright notices in these versions be preserved
as they were originally; but I can only speak to Mac/65
(Note, some versions of Mac/65 contain an integrated
version of Dunion's Debugging Tool which I do not have
any claim to).

I'm amazed that the Atari 6502 based computers are still
enjoyed by people today, some 25+ years later. Yet, I really
don't know why the Ataris have fared better than similar
computers of the same era.

> I have also reproduced the BASIC XL manual in PDF form and will be
> selling repro's of the PDF in printed format. Currently working on
> Action!, then Mac/65, then finally BASIC XE. PDF is available free
> from the site, the the manuals will be for sale minimally over the
> cost of printing.
>
> Corey
> 8-Bit Classics

I still have all of the original Mac/65 source and many
of its versions as cartridges. I also have all of
the Mac/65 sources for Basic XL and Basic XE, since I
was the principal maintainer of the products (except for the
new floating point package, which Bill Wilkinson wrote).
(Yes, Mac/65 built Basic XL and Basic XE on an Atari 800 with 48k.)
Someday, I'd like to do something with this stuff, because
I fear it may be lost to time and it's a unique piece of

computing history that should be preserved. But, I'm reluctant
to do _anything_ because of the uncertainty of who actually
owns the Basic XL and Basic XE (and DDT) Copyrights today.
Again, because I rarely get rid of _anything_, these are
probably the only surviving copies of the orginal source.

Heh. We got a new Sun Blade 1500 in one of our labs at work recently, with a brand new install of Solaris 8. I logged in at the console, opened a Terminal window, started typing a command, and needed to hit Backspace. On the screen:

^H

Argh! ;-)

On the Commodore 64 (and Ataris as well, I presume), the values also represented BASIC tokens. You could write some very strange looking yet functional programs through careful use of PETSCII graphics embedded in the program (Jim Butterfield is the master of this). Plus there's the famous "Insert Mode" where you can do all kinds of bizarre things.

And there is yet another disconnect, with keyboard scan codes. So to expand on your example, you would press A (keyboard code 10), and an A (ASCII 65) would appear, and appear in screen memory as value 1 (A). o_O

I doubt Lance Ringquist owns anything (copyrights, source, or otherwise) because as my lawyer stated, he has yet to establish proof of ownership. Last person I believed own such would have been Mike Hohman. My efforts to contact Bill Wilkinson (OSS) or any members of the original ICD Team (as well as Mike Hohman, FTe) have been unsuccessful. Whatever hacks, mods, or cracks I (when I say I then I speak for myself here but I'm sure everyone else will agree) apply to any OSS, ICD, or FTe product, the relevant copyright information will be left intact. It is not my intention (and I'm sure not the intentions of others) to claim such products as my own. The only reason I would need such source code from BASIC XL/XE, Action, MAC/65, SpartaDOS, etc. would be to adapt it or modify it for my alternate O.S. project and nothing more:

Thanks for the very interesting post! I love to read history of old computer days like this.

Yes, all the versions that I carry have all said copyrights. You would actually be surprised on the following these products have. Mac/65 and Action! especially. The 8-Bit days seem to come and go, but will live on forever if we let them. I am trying to help preserve this as much as I can. If I step on toes, let me know and I will be happy to remove products. I contact original copyright owners (when I know how) and am willing to reimburse them for their hard work if they would like me to.

Very interesting on the sale, you rarely see the option of being able to keep source and redevelop to really recompete with the same product that you sold (even in the 80's).

Great to see that you are still part of the community!

Corey

What do you think? <

I used to own a Supra interface -- bought it from ICD for $5 or $10 at one of the AtariFests. I did get all the docs and stuff from Bob Klaas' bulletin board, but don't think I ever actually ran it. Having said that, there are (at least) two potential problems you may be having. First, make sure that the contacts are clean on the XL and the interface. I mean *scrupulously* clean! IIRC, the Supra interface did not have gold contacts. I use Caig Laboratories "DeoxiT" -- best contact cleaner I've found. Then follow up if possible with a contact-enhancer. I now use Caig's "Pro Gold.". (Always follow the mfgr's instructions.) If you are using a ribbon cable, make sure it is in good shape and short. And that its contacts are likewise clean and tight. Second, I am a MyDos user who only occasionally uses Sparta (mostly SDX). But I did have some experience with disk versions of Sparta -- 3.2d? I likewise had problems with it on my HD, and read the same from other some other users. I went right back to MyDos, and have been there ever since -- with no HD problems. I'm suspect that newer versions do fine with HD's, but if you are using an older one, it's something to consider. -Larry

Please make a copy of it and burn it to several CDs! It would be great if
eventually the source code can either be turned over to the public domain,
or something is done with it for the Atari 8-bit community.

Thank you Vidar!

I was beginning to think I had imagined this game.
For years I've kept my eyes out for this game (off an on) on all of
the websites that catalogue these things, and I've never come across
so much as a reference to it. I remember it being reviewed in a local
hobbyist magazine when I was a teenager, and playing it via a
compilation diskette such as the one you've linked to here.

I'll see if I can get it added to some of the cataloguing efforts.

I hope you're archiving your collection. If you have such "unknown"
gems as this, who know what else you might have that has been "lost."

Thanks again!

RM

I can give you a fuzzy update.

ICD's owner went through a divorce and for quite a while no products were available. AFAIK after the divorce was settled the 8-bit products were put up for sale.

Probably the two leading bidders were Mike Holman(FTE) and Bob Puff with Mike winning. The purchase was mostly rights and a pallet of ICD PR:Connections. No truckloads of MIOs, just rights and an occasional piece of undocumented code. There was enough there for Mike to update and make SDX carts and a slightly modified version of Action!

Mike distributed one of the disk based versions of SD and disk based MAC/65 with DDT as freeware. I think he still had some manuals and those he offered for sale. Anyway quite a few OSS products made it back into the pipeline.

Mike was in the process of developing some major modifications to the 8-bit when he ran out of gas, gas being time, money, and energy. You may be able to find some of the references to it on the web, 65816 processor, Mars board, that kind of stuff. Lots of FPGA and FLASH memory type of mods, in circuit programmible so you could do stuff like have built in BASIC XE and hot swap OS.

That's were we've been for the last decade. Newell came forward to say that Mike didn't complete the contract for his memory upgrades so he was now putting them into the public domain. Occasionally someone posts about how they are declaring all FTE products PD but it is mostly BS from people that are frustrated or clueless about intellectual property rights. AFAIK most rights worth having still reside with FTE.

The 8 bit scene has changed a lot. Used to be a lot of programming interest and "How do you...?" type hardwre and software questions and answers. Seems to be mostly about "Where can I find the XYZ game I played in grade school?" now. I hid the last of my hardware ~3 years ago when my S.O. went on a "Throw this crap away!!!" war path.

There is also the SIO2PC work done by Nick Kennedy and Steve Tucker. Betweem them they have just about eliminated the need for a hard drive or Happy with software and hardware running on everything from an 8088

DOS PC to Windows XP.

There's other stuff out there like IDE drive interfaces, USB interface, and FLASH cartridges for abandonware software. You can even put an Atari BBS online over the internet now with a simple cable and software.

There is even MAE editor/assembler by John Harris. I'm sorry to say I have never used it but it's reported to have features like full screen editor and be faster then MAC/65. I lost the faith and switched over to TASM on an MS DOS clone long before MAE came out.

Well, there WAS a 30-second lag between my post and the actual email.
You're just too fast for me. :)

And don't forget, every 5 years I pop up with "I'm gonna make this awesome new game!" and then never do. D'oh!

Fortunately, my wife understands Atari was my first love, so I get to keep it all set up in my office in our apartment. ;^)

And BTW, hi Rick!!!

I'm not sure this is the correct game but Atarimania.com has Galactic Adventures by Paul Murray published by SSI.

http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=2124

Works on my 800, 800XL, and Atari800Win Plus 4.0 (final). Well at least the game starts and I can save to disk (don't forget to format a blank ATR ahead of time, btw). I haven't really played beyond a few minutes.

BTW, I prefer multidisk games on the emulator. Rename your disks in sequence (e.g. name1.atr, name2.atr, name3.atr... or nameA.atr, nameB.atr, nameC.atr.., or any final numbers or letters in sequence, and you can toggle the image to drive D1: by pressing ALT + N (for Next Image). It's convenient to use the same sequencing for your data/game save ATRs. Write protect the program ATRs.

As for Hypnotic Land I'll also try to email it to you. Is the "OLA..." AT ONLINE dot NO the correct address?

Yes, that is the correct email address. Thanks. I did find Galactic Adventures, at the site you mention, so you don't need to send that, but the Hypnotic Land would be great. Thanks

Actually, all the files are on the way!

Hypnotic Land was compliments of a friend, from Holmes CD #3.

Enjoy.

My S.O. still loves your game Gem Drop; she plays the net version all
the time. Figure a baseball player that strikes out/gets out 70% of the
time still makes it to the Hall of Fame. So it should be for games.

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

No. The only sources I have are Basic XL, Basic XE,
and of course, many versions of Mac/65.

Amazingly, Bill Wilkinson acqiured the original version
of Atari Basic in a similar way. This is why OSS was able
to sell it at the same time as Atari was selling their
Basic. Bill wanted to improve the original Atari Basic,
(I don't know if anyone remembers OSS's original offerings
were disk based versions with enhancements before they
started producing cartridges) but was not really required
to do so...

Seriously 1600X1200 photos?

That would take a day or 2 to load on dial up! :D

I still got a problem with someone that has an opportunity to find items
like that but have no respect other than stacking it on end and never
bothering with it again. (sniff)

VastFear

SpartaDOS is stable. You probably experience some connection problems
between the drive and the computer (weak or dirty connections), or some
of the setup components is a bit damaged thus working ureliably.

I have a dedicated Dos computer that I use with a registered version of APE for DOS. The DOS computer serves two functions: The peripherals for Atari8 and I have old DOS programs I like to use. I use a modified 1200XL and it is a really nice setup. Ape is great software. Anyway,I still have a stand alone Atari8 computer with Supra hard drive. I don't know why with the APE setup and all but I do! I will clean up the connections when I go at it again. After the last crash I have been hesitant.

Hi there,

I am selling my complete collection of computers (over 570 different ones).
If you are interested in some computer(s) from my collection, just mail me
at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you to
the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS MESSAGE
PLEASE!

In max. 2 weeks time I will start a mailing list and everyone will be able
to bid on SEPARATE computers.The exact procedure of the sale will then also
be explained

So...please don't mail me saying : I am interested in X and I want to know
how much you want for it as I don't have prices set.

As you can see from my 100% positive feedback on Ebay (member ChaosDM)
this is not a scam, but a serious sale. I don't want to go through Ebay
directly, because listing 570 different items
separately would take AGES!

Anyway...the list of the collection can be seen here :
http://users.pandora.be/F-242/Computers.htm

There are a LOT of very and ULTRA rare items in there

For example :

A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
A LOT OF ARABIC MSx's
A LOT OF RUSSIAN COMPUTERS
ETC...

Cheers,
Dimitri Kokken

Ken,

Pictures of the inside of a 1090XL won't do you much good. The 1090 itself is just a case and a backplane board with card slots. There might be a chip or two that are just some TTL logic chips. Most of the circuits for the various devices intended for the 1090XL are on circuit cards that would plug into the card slots (e.g. RS232 card, 64k RAM card, etc).

Here's about the best image I could find of the inside.
http://www.computer-history.org/Atari-1090xl.htm
http://www.atarimuseum.com/computers/8BITS/XL/xlperipherals/1090xl.html

As best as I can make out from the photograph U6 looks like it says 74ALS643, U7 and U4 look like 74ACT244. I'm not sure what U5 is. It could be another 244 chip. But they do mainly look like they are signal driver chips for the XL's pararllel bus connection to the 1090XL.

Good luck. Sorry couldn't help much more.

What might be a better idea, if you are intending on making a 1090-alike device for the 8-bit, is to look into the project to connect IBM ISA adapter cards to the PBI. I believe the project was highlighted in MyAtari on-line magazine a couple of years ago, complete with schematics, theory, etc..

Just an idea.

3871. atari++ 1.44 ready

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-24 12:06:26 UTC
From: Thomas Richter <thor@mersenne.math.TU-Berlin.DE>
Message-ID: <djiio2sfb1@mamenchi.zrz.TU-Berlin.DE>
Source record: 9628

Hi folks,

a new release of the C++ based atari 8-bit emulator is ready
for download at its usual URL at:

http://www.math.tu-berlin.de/~thor/atari++/

What's new in this release: Not much visible, but quite
something changed. The most notably change is that it compiles
now fine on FreeBSD and on 64 bit platforms. I especially want
to thank Alexander Mï¿½ller for helping me to get the 64 bit
port ready, this release is mainly due to him.

Despite some "timing fixes", the floppy emulation contains
now some undocumented diagnostic commands of the 1050.

- Fixed the SetIRQ service routine of the built-in Os.
- Fixed (again) the Antic NMI/DLI generation.
- Fixed CPU handling of the WSYNC register (broke Atlantis)
- Fixed the keyboard handler of the 5200 emulation which
did not generate the up/down bits properly.
- Fixed the light pen code generation.
- Fixed parts of the 65C02 emulation, zero page access was
not extending properly to page 1.
- Fixed a lot of compilation problems on 64 bit architectures,
special thanks goes to Alexander Mï¿½ller for helping me to
hunt down these bugs.
- Fixed the SDL detection in configure.
- Fixed the player generation logic again a bit, did not
support horizontal player splitting quite as it should.
- Improved the emulator handling of warnings, you can now
go back to the menu.
- Added emulation of 1050 internal diagnostic commands.
- Fixed SIO return codes for SIO bypass routines.

So long,
Thomas

hi Glenn,
well, I am trying to get an idea of what was actually buffered. I
was reading that 1090xl.txt file and saw some pretty nice ideas in it.
not expandable is the biggest problems with the BlackBox, MIO, Supra
interfaces. and wow, your eyes are sure better then mine, I couldn't
make out any of them. thanks for the links and the help.

hi Shawn,
I did give this idea some thought. maybe for some future tinkering I
may do that. the ISA bus is about as poorly supported now as Atari
1090XL :) PCI opens up a whole new can of worms. but I have been
keeping some old isa hw just for this.

I'll also bring at least some INFO about the FlashBack 2, if not an actual
device. (Where can I get one? Amazon doesn't have 'em yet, it seems.)

I'm getting one from Walmart for Vidar Olavesen. They keep
pushing up the release date on them. Was supposed to be on
10/25/2005, which is today, but I haven't heard that they
shipped it yet.

Hello Micheal did you forget I sent you a picture of my American NTSC
65XE which includes an ECI port? I thought you were going to adjust
the FAQ to reflect this. If you need to see another picture or any
other info regarding the later revisions of the NTSC 65xe (which are
basically 130xe's with 64k memory) please feel free to ask

On November 1, 2005 I'll be putting some atari 8-bit items for sale on e-bay. For a preview with pictures and contact information see http://brookwoodtechnical.com/atarisale.html. I'll post again when the auction goes live.

Thanks for your interest!

3883. Atari Telnet users

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-26 01:47:47 UTC
From: You <you@cogeco.ca>
Message-ID: <BF845882.4727%you@cogeco.ca>
Source record: 9638
Cross-posted to: comp.sys.atari.8bit,wduke@cogeco.ca

Okey dokey, a while back, Doc Clu (aka: Greg Goodwin), asked me to setup something so that Atari 8-bit users could resolve domain names on their Atari 8-bit so that they may telnet to Atari bbs' on the Internet. Well, I've done just that.

I have setup a Macintosh Quadra 700 with NetBSD 2.1_RC6, and it is currently online at this IP address: 24.57.165.180 *or* at this domain name: macsale.dyndns.org port 23

You may login as: guest with a password of: guest

To get an IP address from a domain name you would type the following at the prompt:

dnsquery hostname

Example:

To get the IP address for macsale.dyndns.org, you would type:

dnsquery macsale.dyndns.org

To which the Quadra 700 would respond:

```
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 36629
;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 5, ADDITIONAL: 5
;; macsale.dyndns.org, type = ANY, class = IN
macsale.dyndns.org. 1M IN A 24.57.165.180
dyndns.org. 13h52m55s IN NS ns2.dyndns.org.
dyndns.org. 13h52m55s IN NS ns3.dyndns.org.
dyndns.org. 13h52m55s IN NS ns4.dyndns.org.
dyndns.org. 13h52m55s IN NS ns5.dyndns.org.
dyndns.org. 13h52m55s IN NS ns1.dyndns.org.
ns1.dyndns.org. 13h52m55s IN A 63.208.196.90
ns2.dyndns.org. 14h41m1s IN A 204.13.249.81
ns3.dyndns.org. 2h16m11s IN A 63.209.15.210
ns4.dyndns.org. 19h57m10s IN A 213.155.150.205
ns5.dyndns.org. 23h28m55s IN A 63.208.196.91
```

And there you have it. You can clearly see from the above that the IP address for macsale.dyndns.org is 24.57.165.180. Pretty simple, huh?

Anyway, feel free to screw around on this machine. You will start in the home directory for guest and you'll have to cd your way to other directories if you want to snoop around or play. There are some games in the /usr/games/ directory if you're so inclined. I find that playing Tetris over a telnet connection is kind of interesting.

If you'd like an account with a bunch more privileges, send me an email with your chosen username and password.

3884. Hard Drive Bench Marks?

Does anyone know if there are any bench marks for hard drives/systems
used with the Atari? I'd like to compare several systems -- which
probably means comparing "host versus host" more than anything. -Larry

3886. Getting back into Atari 8bit after a few year hiatus

Newsgroup: comp.sys.atari.8bit
Date: 2005-10-26 16:59:07 UTC
From: "Bo S." <bobo_snyder@hotmail.com>
Message-ID: <11lvdeupva755c4@corp.supernews.com>
Source record: 9643

I refound my atari love about 5 years ago and started collecting atari stuff again . I amassed a pretty good collection of non-rare stuff (no 1090xl or 1450xlds or anything like that but i did manage to get like 4 1200xls which was my favorite system in the early 80's).

Anyway, in the last 3 years, I put it on the back burner because I was renting a home and not owning and didn't have a place for it. Well recently I bought a house and have been setting up all my atari stuff once again.

My question is this, what is the status of hard drives interfacing to the 8bit world of ataris? I have plenty of older 2 1/2 notebook hard drives and I would love to mount one of those into one of my ataris but I'm not sure where to start.

Hi Kevin, yes, thanks for that.

What I forgot to do was feed the faq-server with the latest copy of the FAQ list, dern it. This posting was the same version of the FAQ that was posted two months ago.

I did the faq-server update just now, so the changes I made over the last two months are guaranteed to show up two months from now in the next posting.

I revised section 1.7 like this:

Introduced in 1985 as a replacement for the 800XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's and some late-production North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

Thanks,

-Michael

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> back!

When I first got back into the Atari scene in 1998 after my Hiatis (since
like 1989), there was not much in the way of getting a hard drive, aside
from the older options...

ATR 8000 to MFM or IDE drive (ike!)
Black Box to IDE or SCSI drive.

Now you have the MyIde drive setup as was mentioned above, which I and
MANY Atari users have. There are other interfaces, and don't forget the
virtual drive setup in the APE interfaces, which is actually what I and most
of use a lot more than anything. :)

Unfortunately you can't derive any useful information on hard drive interfaces when they are hooked to different drives.

As I understand it the problem is most modern IDE drives use huge amounts of RAM and will automatically perform track buffering. They can be programmed to mimic several different configurations, [heads, tracks, sectors]. So for reads and writes it can end up that all you are doing is essentially reading from a track buffer/ramdisk. Unless of course you happen to hit upon a sector that is outside of that track in which case another track is read in/buffered.

Only valid test would be with identical drives on different interfaces and even that could have some problems.

What happened to the sio2ide interface on the imported pages (i had to bring up the pages via waybackmachine)? That interface really intriuged me.

I really am looking for something that is buildable internally into the machine whereas the myide card is external.

If it really doesn't matter, then I will go with the myide though. I just like the idea of having the hard drive built into my 1200xl without me having to swap cartridges.

Now thats what I would like to see - maybe one of those 2.5" hard drives
or even a card?

I have a bunch of those 2.5 inch drives and a few spare cf cards also.

I found something that there is internal myide interfaces, i'm going to look
into that.

Are there any drawbacks to the MyIDE interface?

Thanks,
Bo

You can certainly build it into your computer, and you can use a 2.5" drive
or a IDE to CF adapter. Many other people have done this.

>Are there any drawbacks to the MyIDE interface?

I would say that the only drawback is that you need a replacement operating
system to use it. Some of the other interfaces that are interfaced via the
PBI/ECI don't need a custom OS, but they will be more expensive to build
and more elaborate because they have to conform to the PBI interface/driver
specifications.

The other drawback that I can think of, is that you only can use 256 bytes
of every 512 sector on the IDE drive, since the MyIDE interface is only an
8-bit interface. Quite a few of the IDE projects for the 8-bit operate
this way though (cheaper, easier) and besides, how much storage space do
you want attached to your 8-bit?

Personally I have bought and developed some applications for the MyIDE
interface because it is inexpensive and not too complicated. I think
Sijmen has done a great job with it.

The version 4.x OS is going to be great once its released.

Well what I am looking for is a means of having all my atari games that are
on floppies stored on the hard drive. Its mainly for little programing
(like in basic like i used to do 25 years ago, holy cow, 25 years!) and
games.

The only thing that I really want, is to be able to use my atari 1200xl
rather than an XE based machine and the internal kits look like they are for
XE based machines. I always loved the keyboard on my 1200xl. The xe based
machines seemt o have mushy tramiel designed crap for keyboards.

Will it also work in conjunction with the SIO2PC cables? I want to have a means of transferring data from and to my main computers to my ataris and floppys are just a bit too archaic these days.

I'm not worried about storage space on the hard drive. if you cut a 4 gig in half, its still way plenty of storage for an old atari.

Not sure, but won't the TT-touch keyboard enhancements for the ST/Falcon
also work on the 65XE and 130XE keyboards as well? They actually do make
the keys a little better.

The internal interface that is being sold via Mr.Atari's website will work
inside your 1200XL I believe (email the guy selling it to be sure) but last
I looked there were only instructions for mounting it in an XE.

>Will it also work in conjunction with the SIO2PC cables? I want to have a

It works great in conjunction with SIO2PC.

> I'm thinking I might want that extra bit of space at some point...

Hi Slor!

Your connection will stay. As you know, even older TV-Sets have a RGB Socket (We call it here SCART).
The Antenna out on this oldies, I see it more as a last exit. With today TV-sets you donďż˝t really need it.

I donďż˝t know how it looks like in the 800XL. I have removed the HF Modulator-PCB in my Spectrum 48K.
Built in a (3 parts) small RF-Out. Now I can connect it to a Video-IN (Yellow sockkets), making already a far better picture than the Antenna out.
I have also found a RGB Out project. It takes directly Y, U, and V from the Videochip and makes a solid rock stable RGB Picture. Probably better, or at least as good, as a 800XL. But there is no place in the small speccy case ;-(....

I donďż˝t think you will get troubles, disconnecting the HF-Modulator. The circuitry of the mighty 800 is not known to me, sorry. I have never been in need of :-), already everything.... Joystick, RGB-Out, DiskFloppy Connector... etc.

Probably the best 8bitter for all times. The first, but till the end the best (not mentioning the small gfx-stepups between the VCS2600 and the 800/VCS7800). But I think the 400/800 is not much younger than a VCS2600!??

In my case (Sinclair ZX-Spectrum) were two cables, going in the HF-Modulator Case. One Red (isolated), and one blank. These two should be disconnected.
In your case you could remove the whole Modulator Case, if so.

My best wishes to you...

Best Regards,

Daniel Mandic

Hi JR, Rick-

Thanks for the replies and link. Yes, I agree, Rick, but I still find the AtariAge data quite interesting. But your point about needing common drives is well-taken.

Here's where I'm coming from. My MIO & Seagate MFM Drive (ST-251) seemed definitely slower than my then-new Black Box. Since the BB read/translated 512-byte sectors and used a much more modern Conner 3-1/2" drive with a decent buffer + many more sectors per track, that *seemed* logical. Many years passed, and I got a KMK-JZ interface and ran it with several different 3-1/2" and 2-1/2" drives. It seemed a little slower than the BB, but very acceptable. (It is a very nice interface.) Then I got a MyIde, and it seemed a bit slower than the KMK (using mostly the same mix of IDE drives.) Still, an excellent interface for the very modest price. But I thought that it would be nice to see some numbers, so the AtariAge thread is a really good start for me. (Incidently, I still remember the "WOW" almost 20 years ago when I got my first MIO & HD set up, compared even to Warp/Ultra Speed floppies.) -Larry

Whoa! This is spooky! I was just going to pose the same question!!!
Honestly!

The RF modulator on my 800XL has always been noisy and I wouldn't use
it anyway. Meanwhile, all the space on the rear panel could be useful
for my reset switch, headphone jack, and future OS selection switches.

I renewed my interest in the A8 about a year ago (after 16 years!).
Since then I've only seen one hard drive interface designed with the
1200XL in mind (though it's not exclusively for the 1200XL). That was
Bob Woolley's SmartIDE.

I badly want to build this project (for an 800XL) but it's too big for
a novice like me unless someone produces a PCB. See the Bob Woolley's
Atari Classic SmartIDE article here.

http://www.geocities.com/atarimods/index.html

Nathan Hartwell, of Magelair.com had been enhancing the design with a
16-bit variation and a PBI redesign but both projects seem to be works
in progresss or his notes aren't up to date.

FamilyNet International Newsgate

A reminder that the Euro-Chat will be going on what is roughly (and this is difficult since this is the time switch from Daylight Savings time over here this weekend) but around roughly 4-5 pm Geneva time or 10 am CST.

Location is at telnet://www.atarinews.org

If you need help getting in my AIM chat will be up. You can reach me at "Doctorclu" in AIM.

Hope you can make it to the Atari chat tomorrow. :)

Don't forget that with the MyIde that you can use the space beyond the 160
meg that immediate accessable for disk images and even better... MOVIE images.
You've seen what Mr Atari did as far as making the preview for the Matrix,
Atari commercials, and TRON playable on the Atari 8-bit right? All that is
stored in the hard drive beyond the regular space. ;)

Hi there Daniel,

I read somewhere that the ZX Spectrum computer had digital video output. That sounds like an advanced solution for an otherwise fairly simple computer, but if the Speccy has 8 or is it 16 colours, all you need is three or four positions for the binary encoded colour signal on the expansion bus.

Now that I think about it, maybe the digital output not available on all models of this home micro.

Anders

Actually, the movies only use space at some arbitrary cylinder number. If
you enable image space, then pretty much all of your hard drive is "used".
If you don't enable image space, most of your hard drive is probably
unused.

You can figure out how your hard drive is used and where to put image space
pretty easily.

The very most partitions you can have with any of the current tools is 8 x
16MB partitions (although this may change in a future release of MyIDE
Config, especially if I get feedback requesting it!) Find how many
cylinders each 16MB partition will take up by multiplying the sectors by
the heads. This is how many sectors per cylinder you will get.

63 sectors x 16 heads = 1008 sectors per cylinder.
65535 sectors / 1008 = 65.015, so 66 cylinders per 16MB partition.

8 x 66 cylinders = 528 cylinders.

So with a hard drive that has 16 heads and 63 sectors the very most you
will use for partitions is 528 sectors. You could start you image space at
cylinder 768 (must be a multiple of 256). Image space goes from the start
cylinder to the last full 256 cylinders on the drive.

In the case of a hard drive with 5000 cylinders:

(5000 - 0x100) OR 0xFF = 0x12FF (or 4863).

Potentionally, space from 768 to 4863 will be used for images. Each image
in our hypothetical case will take 2 cylinders (since we need 1040 sectors
for each image), so you could get 2047 images on this hard drive!

The interesting thing is that cylinders above the image space can also be
used for partitions. In this case, 5000-4863 = 137 cylinders or 138096
sectors. You can take that into account when trying to figure out where
you should start your image space.

The latest MyIDE Config program that I am about to release displays, in the
Utility screen, how many sectors above image space your hard drive has.

That was probably more information than you needed or wanted. :)

Hi Anders!

The HF is the only screen-output on the Spectrum.

Well, colors. The ULA generates the video-signal. She also makes the
colors. (8 with Bright, makes 15 real and always the same resolution
256x192. No gr. xx as the ATARI)
So the only posibility to get a better picture, is via the backsided
Interface Slot (Z80-Bus). There you have Y, U and V. With that you can
make S-Video, Video, HF as well (you like to say RF) and RGB, which is
probably the best. :-)

Digital video output? Even my IBM-PC with DVI Connectors do not have a
digital out. You ought to take the digital video-signal at the CPU side
;-)

Kind Regards,

Daniel Mandic

Vintage Computer Festival 8.0
Saturday & Sunday, November 5-6
Computer History Museum
Mountain View, California
http://www.vintage.org/2005/main/

This is your complete VCF 8.0 event guide! Vintage Computer Festival 8.0 happens this coming Saturday and Sunday, November 5th and 6th, at the Computer History Museum in Mountain View, California.

The doors open at 9:30am each day. Speaker sessions begin at 10:00am and run until 2:00pm. The exhibit and marketplace open at 2:00pm and run until 6:00pm.

Admission is $12 per person per day for full event access, including the speakers, exhibits and marketplace, or $7 per person per day for exhibit and marketplace only (exhibit and marketplace open at 2:00pm each day). Parking is free, and kids 17 and under are admitted free of charge.

Homebrew Computer Club Retrospective

The VCF in conjunction with the DigiBarn Computer Museum is proud to present a 30th anniversary celebration of the founding of the Homebrew Computer Club, the legendary Silicon Valley institution that helped to launch the era of the personal computer. Bruce Damer of the DigiBarn Computer Museum will moderate this panel of former Homebrew members, including Steve Wozniak, Lee Felsenstein, Allen Baum, Len Shustek, Bob Lash and Michael Holley.

Join the panel as they recount their experiences and gab with the group as we feast on some yummy cake, courtesy of the DigiBarn:

http://www.digibarn.org/

VCF 8.0 Speaker Schedule

The speaker schedule for VCF 8.0 is as follows:

Saturday, November 5

Time Session Title Speaker(s)
------- ------------------------------------ --------------------
10:00am Film Screening: The Future of Pinball Greg Maletic

11:00am IOCCC Award Presentation Ceremony Landon Curt Noll

12:00pm VCF Shenanigans Sellam Ismail

1:00pm Homebrew Computer Club Retrospective Steve Wozinak
Lee Felsenstein
Join us in a celebration of the 30th Len Shustek
anniversary of the founding of the Michael Holley
Homebrew Computer Club. Moderated by Bob Lash
Bruce Damer of the DigiBarn. Allen Baum

Sunday, November 6

Time Session Title Speaker(s)
------- ------------------------------------ --------------------
10:00am A History of the Smart Card Jerry Svigals

11:00am Yack 'N Hack: Computers Talk Back Deborah Norling

12:00pm A Personal Re-telling of Personal Dave Freeman
Computer Retailing

12:30pm Nerd Trivia Challenge! Evan Koblentz and
three Uber Nerds
Are you up to the Challenge? Hosted vying for the prize!
by Evan Koblentz, editor of the
Computer Collector Newsletter

1:00pm In The Beginning: A BBS History Christian Wirth
Discussion Joe Russack
Ernie Longmire
A panel discussion to follow-up the
screening of BBS Documentary on day
one of the VCF. Moderated by director
Jason Scott.

For complete details on this year's speaker series including session
abstracts and speaker biographies, visit:

http://www.vintage.org/2005/main/speaker.php

Nerd Trivia Challenge

The Nerd Trivia Challenge is a trivia contest to test the knowledge of
the most serious computer history buffs. Contestants are chosen from
VCF attendees who qualify for play by taking a preliminary quiz upon
arrival at the VCF on Saturday, November 5. Those applicants scoring
highest on the preliminary quiz will be selected to compete in the
Nerd Trivia Challenge on Sunday, November 6, at 12:30pm.

The Nerd Trivia Challenge is being hosted by Evan Koblentz, editor of
the Computer Collector Newsletter:

http://news.computercollector.com

To participate in the Nerd Trivia Challenge, ask to take the NTC
preliminary quiz when you arrive at the VCF registration desk.

Film Screenings

The VCF is proud to present the first ever public screening of a new documentary film titled "The Future of Pinball":

http://www.thefutureofpinball.com

The Future of Pinball is a new documentary on the recent history of the pinball industry. The showing is a beta version of the film and VCF attendees will have a chance to help direct the final cut based on the feedback they provide.

Be sure to catch director Greg Maletic's talk on Saturday, November 5, at 10:00am.

The VCF will also be reprising a screening of BBS Documentary:

http://www.bbsdocumentary.com

The screening will take place on Saturday, November 5, and the film will be shown in its entirety to all VCF attendees. On Sunday, November 6, join director Jason Scott and three of the subjects from the film at the BBS history panel at 1:00pm.

Tours and Excursions

Guided tours of the Computer History Museum Visible Storage collection will be conducted on Saturday, November 5, with Visible Storage open for self-guided tours on Sunday, November 6.

For those interested in touring the DigiBarn Computer Museum, curator Bruce Damer will lead an excursion into the Santa Cruz mountains that will disembark from the VCF at 3:00pm.

Complete details and tour times are available on the VCF 8.0 website:

http://www.vintage.org/2005/main/tours.php

Bring On The Exhibits!

Once again the VCF has attracted some rather fascinating exhibits. Check out what we've got in store for VCF 8.0:

http://www.vintage.org/2005/main/exhibit.php

We look forward to having you at the Vintage Computer Festival. I'll see you there!

Best regards,

Sellam Ismail
Producer
Vintage Computer Festival

3924. Re: Hard Drive Bench Marks?

Newsgroup: comp.sys.atari.8bit

> Unfortunately you can't derive any useful information on hard drive
> interfaces when they are hooked to different drives.

This is partly true, yes.

At the other hand, IDE drives are generally very fast, so comparing different interfaces even with different drives attached you're effectively comparing the efficiency/reliability of the IDE driver code at the Atari side.

Differences in reading speed like between 14k/s and 36k/s (see the thread) may be caused by differences in the actual driver algorithm used combined with facilities the interface itself offers to the driver (e.g. additional internal buffers and the like).

But if some interface/drive combo goes down to 2k/s (yes, two kilobytes a second), then there's doubtlessly a serious problem inside the driver software itself.

KMK

3925. My stock 800XL has chroma output?

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-01 03:37:44 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns9700E6283BA74emuslor@216.196.97.136>
Source record: 9582

I'm trying to get something straight here, so hopefully you guys can help...

Ok, so I have 2 800XLs sitting in front of me. The first one is the one I have had since it was new, my first computer, immortal beloved (maybe that's going a little too far). A while back I did the simplest hack I could find to add chroma output to the machine, which was to put a line from the resistor just above Q5 (can't read the resistor number) to the chroma lead on the output jack. Voila, a nice bright s-video picture that is better than the composite and enough to keep me happy without doing a major video mod.

Now, the second machine is one that has not been modified (at least for video), and much to my surprise it's showing a picture when hooked up via chroma/luma. It's not as bright as the other machine (even a slightly different hus), but it's certainly just as clear. If I hook up the same simple line as I did in the first machine, then it transitions to a brighter version of the display.

So, the question here is what is this second 800XL that already has some sort of chroma output in place? I have read about the "Freddie" models that came out late, but this machine does not have that chip. Is this a very early 800XL that came out before they decided to stop hooking up the chroma? I'm just curious since I never expected to run across one of these with unmodded chroma output.

Oh yeah, and they're both NTSC machines.

Thanks

Atari 'forgot' to connect Chroma to begin with, and nobody noticed or cared much because few if any people could use the monitor output.

S-video input only became commonplace long after the Atari had gone.

Towards the end of the 800XL era, it was re-engineered to connect chroma and to use the Freddie chip, presumably in that order from what you said.

AFAIK, the modulator - at least in XE series - has to do with the Composite
Video signal. Removing the modulator you'll also remove the Composite Video out
of the monitor connector. Apart of that, no problems.

Interesting. I would have guessed that the machine is older than my other
XL, but I could be wrong. I can't find a date of manufacture on it
anywhere like my other one. Is there anything telltale in the location of
manufacture? Those are different...

1) Check behind pin 4 (I think that's the right number)of the DIN
connector. If there is a trace leading backwards then Chroma is indeed
connected. If the pin is just an empty solder point then no
connection.,

2) If there is no trace then check your video cable. Perhaps it's been
modified to bridge the Composite and Chroma pins to make Composite
available on what should be the Chroma lead. That was the other cheap
fix, Composite + Luminence instead of full Chrominence + Luminence.
Produces better output than Composite alone plus you still get some
artifacting.

To be honest though, I've never heard of it being done at the cable because back in those good old days we used RCA connectors (not S-Video connectors) so one could simply plug in the Luminence lead and if the Chrominence lead didn't work we plugged in the Composite lead into the Chrominence input on the monitor.

OT: Was Commodore the only company producing CRTs with separate Chrominence and Luminence inputs? I can't seem to remember.

LOL I would call no output a problem!

3933. Problem with one of my 1200XLs

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-02 02:08:19 UTC
From: "Bo S." <bobo_snyder@hotmail.com>
Message-ID: <11mg7sji13pc882@corp.supernews.com>
Source record: 9590

I really don't like the idea of a dead computer so I want to try to figure out what is wrong with one of my 1200xls. When I turn it on, I get a black screen with some faint horizontal (short, like 1/4 inch wide) lines all over the screen. They flicker for a bit then the screen just stays completely black.

I tore the computer open and pulled all the chips and replaced them firmly and i got the same behavior.

However I also got the computer to boot up and make the funny whrring noise and then boot to the ATARI logo twice but as soon as I turned it off and turned it back on, it went back to being flakey.

I can leave it off for a day and turn it back on and it won't work right away.

Any ideas??

I don't think so. I think i have a couple of rca monitors that have both
chroma and luma inputs as well as standard composite.

Just had another old RAM chip go out so a bad DRAM will be high on my
list of possible things that went south.

One of my favorites guesses over the last 20 years has been galvanic
reaction. The dissimilar metals [copper, zinc, lead] set up the
equivalent of a galvanic cell at the connectors. A lot of people just
leave their busted computers on overnight and by the next day they are
healed.

That you are getting screen garbage and noise is good. That means at
most of your LSI chips like Pokey, GTIA, ANTIC, CPU, are trying to work.

Hmmm...
take a good multimeter and check all caps for leaking.... on off those caps
is dry..
and also take a big mag. glass and check solder points.... life time for
cheap
solder are 8 or max 10 years....

bye... Rodrigo..

Hello,

I posted earlier about 9 items I'm putting up for auction on ebay.

Here's a link to what's available so far:

http://tinyurl.com/ahtcd

The remainder will go on sale tomorrow at 7:00 pm PST. The above link
should still work.

Thanks for your interest.

Actually I did check that (the caps). None of them appear to be bad or
leaking.

I'm going to leave it on overnight to see if that helps it run again.

Man, dont' people know how to SNIPE!?

6.5 days left on the auction and there are already bidding wars on it.
Geeez.

Watch the item, don't bid on it until the last second and then it wil
prevent all sorts of bidding wars!

The included SDX cartridge makes it a hot item. That typically goes for over $100 by itself on eBay. Still, if it goes over $300 I would consider it high for those items, even in nice condition.

True.. I agree that they can go bad.

I went ahead and tested it by hooking it up to another one of my 1200XLs and
it works fine on that computer. Also checked the output with a multimeter
and it looks like its reasonable.

3946. How many people have/use XF551 floppy drives?

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-02 18:57:20 UTC
From: "Bo S." <bobo_snyder@hotmail.com>
Message-ID: <11mi30c6nelsq34@corp.supernews.com>
Source record: 9502

I have a wide variety of floppy drives at my disposal. I have a few supras, i think 4 or 5 indus gts, and several 1050s (no 810s though) and a XF551.

Is there anytyhing really useful or cool I can do with the xf551? I vaguely remember seeing a webpage where you could mod a xf551 into a 3 1/2 inch drive, is that still out there?

3947. Looking for Hamtext Rom/Image

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

There are several nice upgrades:
The Bob Woolley 3-1/2" upgrade (also published in Antic magazine).
The CSS upgrades (plural) -- still available at last check at their web
site.
The HyperXF upgrade.

And also look at the most excellent Atari 8-bit FAQs.

William Kendrick <bill@newbreedsoftware.com> wrote:
> I'll once again be bringing my Atari 800XL, Atari Lynxes, and I think
> this year I'll bring my _old_, woodgrain Atari 2600. :^)

The woodgrain lives! It's a little fussy, so I might bring my Junior, too.
My Atari 800XL will be there, _alone!_ No laptop or SIO2PC cable. [*]
Everything'll be cartridge or coming off my 1.6GB HDD via MyIDE cart!

Sadly, I didn't have money/time to get the OS ROM upgrade chip for my 800XL,
so my MyIDE is still using RAM-under-OS-ROM, meaning there's a lot of cool
stuff I can't show off. (BOSS-X looked cool, but uses TurboBASIC XL.
Can't show most demos, the color JPEG decoder, etc.)

However, I did put the greyscale JPEG decoder and a bunch of JPEGs on the
16MB D2: partition I created, and filled a dozen Image partition slots
with disk images of games & demos that do work fine with MyIDE.

If you're in the SF Bay Area region of California, the event is this weekend
in Mountain View:

http://www.vintage.org/

[*] Mostly because my wife is the one with the laptop, and she'll have it
with her and will be out of town this year. :)

Well, you should still have Chroma and Luma, just no Composite.
That means you'd need an SVideo cable, or some-such...

I THINK. I'm not the expert in this field of Atari. ;)

If you need room under the hood, you could always remove the 9VAC to 5V
DC componets and run it off an external 5V computer supply.

3958. "TRON" released on cartridge

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-04 02:20:51 UTC

"TRON" is a little 2-player game I wrote 20 years ago. This year, 2005, it has been published on cartridge by Video 61.

The package comes in a box that includes the cartridge with a nice label, along with an instructions sheet. (I wrote the instructions earlier this year.)

The game itself is a very simple programming effort, yet I still think it's quite fun. A classic genre.

Requires: a 48K 800/XL/XE computer and 2 joysticks.

Available from:

> And? ;)

Well I got home last night and plugged it in (no cartridge or anything else). I then turned it on and it worked (it has done that before after it sat for a whie, it would power up then not reboot after i tried cycling the power swtich).

I left it at the multicolored ATARI screen overnight. Woke up this morning and it still was at that ATARI screen. Background was red though, wondered why?

Rebooted the system. It booted up fine but I noticed that the blue screen with the cursor while it makes the funny whirring sound was a reddish color but it booted. It showed the atari screen with no problems.

I then shut it down and put a pacman cart into it. It booted up fine and the game played fine however the colors were off. It was like they were in the wrong cycle, not a color missing (by that I mean the screen looked fine and you could see the different colors, but it was like they were using the wrong colors, it wasn't a matter of a missing color as a problem with the cable).

The sound also was funny, it faded in and out while playing. I would hear the game then it would slowly fade to nothing and then the sound would fade back in.

I plugged the powerspupply and monitor cable into my other 1200xl and it worked perfectly again.

So before I left this morning for work, I went and plugged the problem child 1200xl back in and left it on the pacman demo and went to work.

Any ideas what still might be amiss?

Cuz there are none there. :)

I also see some other cart games I've never heard of
(e.g., "Clowns and Balloons", which sounds like either Circus Atari!
or Kickman), and they don't really have any add'l info... :^/

After 9 minutes (7 min?) "attract" mode kicks in, like it would in most
situations. However, since the rainbow color effect in the "ATARI" image
is a display list trick, the attract colors don't affect them... so, the
background changes colors, but the rainbow still looks rainbowy :^)

> Rebooted the system. It booted up fine but I noticed that the blue screen

Oh, hrm... so maybe NOT.

Oh, there's a POT (a little knob) underneath. I THINK you can access it
with the case still on. (Bob Woolley has had my Atari 1200XL for the past
20 or 30 years ;^))

It might need to get twisted. It should just affect the hues you see.

But then you go on to say...

> The sound also was funny, it faded in and out while playing. I would hear
> the game then it would slowly fade to nothing and then the sound would fade
> back in.

And my lame diagnostic skills won't help. :^) I'll let a smart person
answer.

Good luck!!!

I need some cash and some room in my closet, so I'm considering selling some of my excess 8-bit stuff on Ebay. Before I go to the trouble, I'd like to know if it could be worth my while. I checked past Ebay sales, but I don't ever see many of these items. Could anybody give me a guess on what some of the following things might bring? All items will be in working order or they will NOT be put up for sale, and any needed power supplies and SIO cables will be included. None of these have the original boxes anymore.

(2) 256K Rambo-enhanced 800XL's
(2) stock 800XL's
(1) US Doubler-ed 1050 drive
(1) Indus GT drive
(2) stock 1050 drives
(1) Apeface printer interface
(1) MPP printer interface
(1) Atari numeric keypad (I forgot the number)
(1) SX212 modem
several joysticks and paddles.

Please note: I am not selling ALL my 8-bit stuff, just what I consider excess.

> Nice! I'll be comparing it to the Commodore JPEG decoder.

Well, sadly, I'll be stuck with only the greyscale decoder, since the
color one requires RAM-under-OS-ROM, which my stock MyIDE requires, as well.

If I were bringing a laptop to run SIO2PC (or, my god, a floppy drive!),
I could use that. But, for better or worse, I'm running entirely off HDD
this year. :^)

Good news, though... a coupla years ago I was playing with converting
videos from AVI/MPG/etc. into something the Atari could display natively
and relatively quickly.

I've got ~260 frames of low-rez greyscale video playing. I whipped up a
horribly lame player in BASIC tonight, and copied the ~750KB video onto
the hard disk. It loads each frame and plays it sequentially. It's pretty
low FPS, but still pretty cool.

One of these days I'm going to have to get one of Mr. Atari's videos onto
the HDD to play. I didn't have time to figure it out before VCF, though. :^/

Okay, that's Circus Atari (prev. to that, Circus in the arcade).
I actually wrote a clone of it for Linux, which has since appeared
on Windows, Mac OS X, and even Sega Dreamcast! ;)

http://www.newbreedsoftware.com/circus-linux/

Kickman is a game I'd love to see on the Atari XL!

I know this is a bit of a long shot....

The UK magazine "Atari User", published by Database Publications/Europress had type-in listings and these were also available on a monthly disk or cassette. I believe they were also made available for download on the Microlink/Telecom Gold system. However, I've yet to find anyone in the world who still has the disks or downloads ... can anyone report otherwise?

Similarly the UK magazine "Monitor" published by the UK Atari Computer Owners Club apparently had a monthly disk containing the respective programs. Again, I can't find anyone who still has copies of the disks....

If anyone has any leads on the whereabouts of these items, please let me know!

Thanks,
PJR

Heh, maybe it's only an Internet Shop today, but way back when the VCS first came out, they were a major chain of department stores.

Sears, if I recall correctly, was one of the first places to sell video games, wide-spread. I believe Pong was sold in the sportings goods dept. ;) (I haven't cracked open any of my old books in a while, so this is off my terrible memory. And, shoot, I'm only 30yo!)

ANYWAY, back in the day, Sears _only_ sold Sears-branded stuff, so when Atari wanted to sell the VCS and various video games, it suddenly became the _"Sears"_ video game system, not "Atari". Numerous games had their names changed. Some games were only available through Sears, too, which is kind of odd. (Steeple Chase). (I _think_?)

Anyway, gotta get to the Vintage show!

Hi William!

I donďž˝t know Sears. Actually I found that Internetshop on the first
hits.

Fortunately we didďž˝nt have such marketing. Only real ATARI stuff were
available. I didďž˝nt (donďž˝t) have much, made in USA, but my (my Brother
and Mine) VCS2600 was one of that. I think I was 7 or 8 Years old, we
bought it very early _:-)), thanky to my mother :-).
A great VCS, we lend it very often and we forgot it one time, so it got
lost.
I am searching for a original VCS2600 (just as a collectible, and
sometimes playing on my TV-Set)
Is this really wood (veneers), on the VCS2600???

I have two 800XL too, but I never used them as a HC. Also not the C64.
But I use an ATARI TT with the TTM195 :-) - my bullion.

Kind Regards,

Daniel Mandic

3978. Assembler Question

Newsgroup: comp.sys.atari.8bit

From: Thomas 'twh' Havemeister <twh1@gmx.de>
Message-ID: <436d1b9a$0$7420$9b4e6d93@newsread4.arcor-online.net>
Source record: 9534

Howdy Friends,

I am a newbie to 6502 assembler. The following code is a routine which
basically protects the screen borders after a X-adjustment of my mouse.

In C/Java style it's pretty easy:

CODE

```
x_new = mx+x
if (mx==positive) {
if (x_new>x_max) {
x=x_max
} else {
x=x_new;
}
} else {
if (x_new<0) {
x=0
} else {
x=x_new;
}
}
```

This is what I wrote in 6502 assembler (I am using MADS):
CODE

```
*************************
* Cursor X/Y/W/H manipulation

x_new dta 0

cursor_add_x .local
; in: x= mx (x-pos diff)

txa
clc
adc cursor_x
sta x_new

txa
bmi _negativ ; mx=negativ? yes -> _negativ
lda x_new
cmp MOD_max_x
bcs _bigger_max
lda x_new
sta cursor_X
```

```
rts

_bigger_max
lda MOD_max_x
sta cursor_X
rts

_negativ
lda x_new
cmp #0
bcs _bigger_equal
lda #0
sta cursor_X
rts

_bigger_equal
lda x_new
sta cursor_X
rts
```

Unfortunately it's not working. The right border (MOD_max_x) works good,
but the left border (0) doesn't seem to work at all.

I have difficulties to code something like "X<0" or "x>0" .. :-(..

what is wrong?

\twh

The BlackBox can be made to share the bus with simple pieces of hardware worth no more then half a euro (slightly over half a US dollar) I was told years ago. Unfortunately, the guy who told me didn't trell me how to do that. And nowadays, he isn't answering his email anymore.

And according to Bob Puff, the BlackBox can be expanded in a simular way as is done with the FloppyBoard. I've had a look at the configuration data, and there is room enough for extra data.

Source record: 9539

I'm exhibiting my 8-bit families of Atari stuff at the
Vintage Computer Festival (VCF 8.0) in Mountain View, California this
weekend (see: http://www.vintage.org/)

I brought my:

* Atari 800XL computer, with:
+ 256KB RAM upgrade
+ Its new MyIDE+MaxFlash IDE adapter cartridge...
(plug in cartridge, turn on HDD, and voila!
Tons of files and disk images available at high-speed!)
+ MaxFlash 1Mb flash cartridge (filled with a halfdozen games)
+ Numerous game cartridges

* Atari 2600 VCS game system:
+ My family's original 4-switch wood-grain version
+ Dozens of carts (many from when I was a kid, many bought recently)
(Yes, I bought a few more from a vendor at the Festival! :^P)

* Two Atari Lynx handheld game systems:
+ Numerous game carts, including some recent releases (thanks, Carl!)
+ Comlynx cable (didn't get used during Day 1)

I've got photos of my exhibit (two 8' tables this year!), along with a few
other exhibits I had the chance to at least wander by with a camera. ;^)

http://www.newbreedsoftware.com/bill/photos/vcf80/

Enjoy!

Hi Thomas,
I think it's (at least partly) because of these lines:

> lda x_new
> cmp #0
> bcs _bigger_equal

bcs will do an unsigned comparison between two numbers, it will branch
if x_new >= 0. But because it's an unsigned comparison, x_new will be
interpreted as a value between 0 and 255 inclusive, and any value
between 0 and 255 will always be >= 0, so it will always jump to
_bigger_equal.

I can see several places where the code can be made better too, and a
few potential problems. What are the maximum values of mx, x, and x_max
in the C/Java version of the code?

Source record: 9542

>From what I've heard, Chroma was a later addition.

My PAL machine (bought new in 1984) didn't have it, my motherboard has "Revision C" printed on the back.

I added it myself yesterday. Just solder a 100K resistor to the junction of R67,R68 resistors on the back of the board, and join it to where the chroma pin of the monitor port is joined to the motherboard.

Easiest way is to solder the resistor to the wire first, then put shrink-tube to insulate it. The addition should be made at the back of the motherboard.

Some of the available Atari 8-bit video mods can be found here:

http://www.geocities.com/atarimods/index.html

> in the C/Java version of the code?
```

Hi Raphael,

thanks for your input. It's true the code is very unefficient. My general problem is that, I can't translate high level language to low level assembler steps. However, regarding my functionality I got another solution from a friend which looks like this:

```
--------------------------

x_new dta 0

cursor_add_x .local
; in: x= mx (x-pos diff)

txa
clc
adc cursor_x
cmp Mod_max_x
bcc _set ; if smaller then set->
cmp #-48
; if it's -48..-1 then set to 0
; I chose -48 because 48+160+48==256
lda #0
bcs _set
; else set to MOD_max_x
lda Mod_max_x
sub #1
_set
sta cursor_x
```

```
rts

.endl cursor_add_x

--------------------------
```

this seems to work. However, now I considered a new problem. What if the value (mx) is bigger/smaller than 48? So what I tried now is to reduce the input value, so that the subroutine "cursor_add_x" works fine. So the idea is to do the following:

```
--------------------------
max = 48
mx = getMovement(); // between -127 and +127

if (mx>max)
mx=max
else if (mx<(-max))
mx=-max
save (mx)
--------------------------
```

I have serious problems to convert that to assembler. I playing around the whole day now. Most problems do I have with that "else if". How can it be translated?

```
\twh
```

I've added Day 2 photos to the bunch. I felt pretty under the weather
today, but still had fun. Someone offloaded a few more 2600 carts on me
(for a buck apeice), and I must say, California Games on the 2600 is
about the most technically impressive 2600 game I think I've ever seen!

Anyway, Day 2 photos:

http://www.newbreedsoftware.com/bill/photos/vcf80/#day2

Enjoy!

Heh, hey, at least one guy I met flew out from New Jersey, so it can't
be _too_ far. (Of course, I'd prob. never go that far for such an event,
otherwise I'd be at all the cool 8-bit scene events in Europe ;))

BTW, my Day 2 photos (at the same page, just halfway down... I just posted
about them here) include some close-up views of the MyIDE boot-up screen
and A8JDPEG, since I knew folks would be curious. (I had some C=64 and
the Russian home computer guys asking me all sorts of questions :))

Enjoy!

Heh, exactly as it is. else... if... :^)

I don't know 6502 assembly, but in C, you can convert this:

```
if (a)
{
A();
}
else if (b)
{
B();
}
```

to the more verbose:

```
if (a)
{
A();
}
else
{
if (b)
{
B();
}
}
```

And convert this:

```
if (a)
{
A();
}
else if (b)
{
B();
}
else if (c)
{
C();
}
```

to this:

```
if (a)
{
A();
}
else
{
if (b)
{
B();
}
else
{
if (c)
{
C();
}
}
}
```

You can see why they came up with the "else if" construct in programming languages, huh? ;^)

I would figure those might get a bit of money but not as much as you would
think. For example, here is a decked out xe system:

http://tinyurl.com/ctpu9

This one sold for almost 90 dollars but it has a lot of add-ons.

> (2) stock 800XL's

10-20 dollars I would say.

> (1) US Doubler-ed 1050 drive

20-40 dollars?

> (1) Indus GT drive

Hmm.. The only one that closed was a nice complete one:
http://tinyurl.com/cwh66
93 dollars.

I would guess then a standard non-boxed one with just the drive might close
for around 25-50 dollars depending on condition. (i bought one last week
for a dollar. :-))

> (2) stock 1050 drives

10-20 dollars?

> (1) Apeface printer interface

5-10 dollars (pretty much guessing here)

(1) MPP printer interface

5-10 dollars (pretty much guessing here)

have no idea but i don't see anyone wanting one unless they were trying tio
complete a collection or something.

> several joysticks and paddles.
Put them all into a lot unless you have something speical and sell as one
pile. You probably won't sell them individually very well.

Bingo, that was the trick. When I had taken my computer apart initally, i
moved the knob tr4ying to figure out why it wasn't booting properly.

Moved it a hair and colors are normal once again!

> But then you go on to say...

Actually I think your "lame diagnostic skills" really were on the money.
Ever since I left both of the 1200xls on over night and for a long peroid,
they have been acting pretty darned normal. Both of them actually were
suffering the weird sound fading effect but that has gone away during the
weekend.

I really don't need 2 working 1200XLs but i just hate having broken stuff.

Thomas 'twh' Havemeister <twh1@gmx.de>:

>I have serious problems to convert that to assembler. I playing around
>the whole day now. Most problems do I have with that "else if". How can
>it be translated?

```
lda NUM1
cmp $01 ; if NUM1 == 1 then foo
beq foo
cmp $02 ; else if NUM1 == 2 then bar
beq bar
jmp done

foo: do some stuff
jmp done

bar: do some stuff
jmp done

done: more code
```

This is a simple way to do it. I'm no 6502 guru and maybe there's a better
way, or some fatal flaw, but this is how I would approach it being a
beginner to intermediate assembly coder.

3997. ISO: "Atari SuperGraphics 3D" (or some-such) library?

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-08 03:47:06 UTC
From: bill@newbreedsoftware.com
Message-ID: <43701fba$0$3521$742ec2ed@news.sonic.net>
Source record: 9454

Someone at the Vintage Computer Festival asked me if I'm familiar with
an add-on library (I assume for Atari BASIC) called -- to the best of his
recollection -- "Atari SuperGraphics 3D".

Has anyone heard of it? Got any info?

Thanks!

3998. 48k 800: Dead SIO Port

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-08 08:02:50 UTC
From: Tarkin <nuke48386@yahoo.com>
Message-ID: <1131436970.219593.143280@o13g2000cwo.googlegroups.com>
Source record: 9455

Hello all,
In my travels I came across an Atari 800, w/ a 1050 drive and
Epson printer (w/ interface)
The previous owner was having disk drive troubles, and not wnating to
futz w/ it, upgraded
to a PC, relegating this treasure to the dump. I rescued it, and my
quest begins....
The 1050 appears to be OK. I bought another on ebay, and it
appears to be ok, but
the 800 will not talk to either drive. I attached each, in their
single-drive configurations, and
neither provokes any response from the 800. As I have the BASIC cart,
typing DOS just
dumps me to the Memo Pad. I tried booting without the BASIC cart, more
Memo Pad.
Basic commands like STATUS, OPEN, and XIO give me ERROR 130.

Does anyone have any suggestions, tips, routines, or other
information concerning
the troubleshooting and repair of the SIO port for the 800?

Your help is greatly appreciated,
Tarkin

3999. Atari Spider SIO cable

Newsgroup: comp.sys.atari.8bit

I seem to recall having seen a way of making a "spider" SIO connection box,
does anyone else recall this, and are there any plans/details on the web.

thanks

Richard

I remember it but not much. There were two version with increasing
'power'. It was both a 3D development environment and a bunch of routines
you could call from Basic. It might have been Antic published and possibly
Tom Hudson? Memory is failing..

I found this via Google:
Product name: SuperGraphics
3-D Display System & Game Tool (by Bill Budge)
Language: called via PRINT "%..." from Applesoft
or Integer BASIC
Hardware requirements: Required are an Apple II
with 48K of RAM and a minimum of 1 disk
drive.'
Operating system requirements: DOS 3.3
There was an Atari 800 version.

Also, someone was selling this a while back:
Supergraphics 3d ref. Manual by P.Lutus Kerby, 1980

Iain

It may be your SIO cable that's bad...don't rule that possibility out.

I had a bad POKEY recently. Sound and keyboard were okay, as was booting
from cassette, but no disc access and no saving to tape. As my machine was
an 800XL, upon booting it jump right into BASIC or Self Test.

Replaced the POKEY, no probs since.

Have you tried completely taking the computer apart and then pulling out and
then reseating all the socketed rom chips? Also might want to consider
doing that to the ram/rom cards as well.

The two different drives had two different cables as well.... I'll ohm them out to rule them out. And I know at least one of them has a good pin 4/GND and a good pin 10/+5v/RDY, as I tested that w/ an LED.

Yes, I had tried to reseat all ROMs and cards....will do so again.

fsh had the info I was looking for, because, while my keyboard is flaky, it's due to the previous owner being a touch-typist, and a fast one
at that: all the most oft-used keys need extra force, although, after 30 mins of use, the keys become less in need of the hammer treatment. But, the keys that are good have excellent, repeatable, typematic delay and accompanying sound.....and the sound commands work excellently, no distortion, clipping, or artifacts. So I had ruled out the POKEY, thinking the SIO would not fail in isolation. fsh has confirmed a suspicion of mine.....that it (SIO portion of POKEY) will fail in isolation.

I will ring the cables, re-seat the chips and cards, and, if all is still not well, order a POKEY.

Thank you all,
Tarkin

4005. question about monitor cable's

I need a monitor cable for my 65xe is there any problem with me using a commodore 64 one? I used to have a cable that had 3 rca jacks coming out of it (I foolishly gave it away with my ol 130xe) and I read somewhere that the cable's work but the rca jacks correspond to diff things depend on whether you use a c64 or xl/xe. Now I see alot of cables with just audio and video and no extra rca, will they work fine on my xe?

Hi Kevin!

I bought a cable from "BOEDER", a local accessoires-producer. On that writes, that it is for ATARI XL , C64, and some more AFAIK. So it should be the same cable for both.

I have used the cable in a Bread Bin C64 and a 800XL, honestly. The Picture is well!!

Best Regards,

Daniel Mandic

4012. 1 meg MIO plus SDX cart on eBay

Anybody see what the one meg MIO and Spartados X cart went for on eBay.Never thought it would go that high. If these items can go for that much (I know they are rare) why wouldn't someone re-release say the: Spartados X cart for $50.00. I sure they would sell enough in the Atari community to make it worth it. As for the MIO. the chips in it were expensive at the time it came out but now one or two chips could do the same work for a lot less. Is my thinking way off here or what?

Winning bid: US $717.07

New stuff has no intrinsic value to a collector. The new stuff like IDE
and SIO2PC interfaces have much better performance and utility then the
old stuff yet they don't go for those kind of prices.

Yes, I had one original Atari DOS 2.0, and one original Atari DOS 2.5
disks, as well as various app disks which had DOS and AUTORUN.SYS on
them.
No response from either drive.

Have yet to get around to reseating the ROMs and chips; will post the
results. I wish someone would pay me to futz with old computers,
instead of the
manuals labor I perform. (I'm a handyman. Today was removing a 500lb
tub.)

Thanks,
Tarkin

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Now that this auction is over and done with (with a bid of $1,635),
does anybody here now what became of the deal? Did the seller decide
this was an adequate price? Was the buyer active in this group? What
sort of wonderous treasures were extracted from this storage unit from
hell?

My daughter plays:

Alf in the Color Caves
Alphabet Bee
Lode Runner
Dog Daze Deluxe
Ducks Ahoy!
Sesame Street: Letter-go-round
Big Birds Special Delivery

probaby some I'm forgetting too. I'm also interested in any "kids" games.

I always liked DonKey Kong and Donkey Kong Jr. My kids still love them and
they are teenagers. Frogger is another one.

Even with a DOS disk, the manuals say you might hear beeping,
and that this is completely normal. Also, the drive manuals
indicate that, with the BASIC cart installed, there will be a
slight pause before the 'READY' prompt. There is no such
pause. (Oh, and no beeps.)

I glossed over or neglegcted to mention that the printer
interface (and printer) would not respond to OPEN commands:
error 130 again. So, between the two different types of
peripherals, and the two different drives, I'm inclined to blame
the 800.

Thanks,
Tarkin

I still say it's the POKEY. If you can't find one, you should consider buying an Atari 7800 Ballblazer cart for cheap off of Ebay. They have a POKEY inside. Needs a little desoldering, though.

Cheers from Germany,

Frank

I resserected my 800 for my niece (age 5-6 at the time) but that would
have been way back in 1986-1987. I can't remember any specific titles
that she liked, perhaps Womper Stomper.

You might try several of the titles from Spinnaker Software. I believe
they were oriented toward younger childeren. Educational games.

Oh someone in this newsgroup recently mentioned Pinhead.

Bill,

The picture you have of the green screen connected to the blue computer is a Sol Computer. It was a 8080 processor based computer. That particular game was a fun one to play on that computer. I remember playing that back in 1978/1979.

http://www.vintage-computer.com/images/sol20.jpg

I wish I could've gone to the show myself, but I had to work the weekend of the show. Have yet to actually visit the Computer Musuem there in Mountain View.

It would be nice to know how to do this. I tried to use the Black Box with
my 1400XL years ago when I first got the Black Box (in 1992). But the
devices in the 1400XL compete for the parallel bus.

4042. black screen problem

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-10 22:25:51 UTC
From: chris <sandporpoise316@yahoo.com>
Message-ID: <1131661551.739964.65750@g47g2000cwa.googlegroups.com>
Source record: 9399

I bought this new keyboard for my Commodore 64 because the last one quit working. It was previously repaired by some one when the screen went black trying to use it who told us that the "gaming chip" (assuming that there is only one- pretty general description or not I don't know) had burned out. When it happened again the same guy tried charging us double and wouldn't give us the keyboard back without giving him $50 for his troubles of just looking. I have since grown up and wanted to revive my favorite all time system. I went on Ebay and foolishly bought a the aforementioned keyboard that had no guarantee of working. The same problem exists after trying the keyboard with two different monitors and disk drives. My questions being:
Did I get screwed on the deal? What exactly could be wrong? Is it possible to fix without buying another keyboard for replacement parts?

To whoever is willing to help thank you from the bottom of my video game loving heart (i mean come on, this system was how I learned to play cribbage) and if there is any extra details about the situation that could help you figure out what's wrong let me know what you don't get. Again thanks to anyone who can offer any help.

True, but the MIO is really a nice piece of hardware and the 1 Meg
version allows alot
of options with RamDisks and Printer Spoolers and is Reset Proof. If
your 8-bit crashes,
99% of the time anything in the MIO RamDisk(s) is/are safe and you just
have to reboot the computer.
Plus you get a built in printer port and RS232 port which goes up to
19200 Baud.
Not Fast compared to todays computers, but in the day it flew.
And of couse the 50 pin Hard Disk port.

Maybe not as good as the Black Box Hard Disk system, but it works well
if you get the right drives.
You can have alot of room for a BBS even with the partition limit.
That's another thing I'd like to see a upgrade for.

The SDX cart and the MIO are a great combination. Disk Based Sparta also
is very good with
the MIO.

I'd like to see a hardware upgrade to increase the RS232 Port speed and
maybe add a Flow
Control Option. As the MIO doesn't use Flow Control and must be turned
off when using most
modems.

Still thats a high price, It almost tempts me to put mine up on E-Bay,
As I have the exact hardware
that was up there for sale.

But to me as a collector and user, I can't bring myself to sell the 1meg
MIO, it adds alot of
extra power and fun to an 8-bit.

I did end up buying a SDX cart and manual off of E-Bay and paid pretty
much the going rate which
is around what it costed New way back. I have 2 SDX carts now. A few
months ago I had none and
couldn't get one anywhere.

I'd like to see the MIO re-made with some good upgrades. Or a similar
product.
Take the best of the MIO and Black Box and throw in a major speed
upgrade and some
good chips to program. A few USB ports for add on hardware. It would be
cool. And
would probably sell quite a few units.

Hrm, if noone here answers (since this is an Atari 8-bit newsgroup),
you might want to try comp.sys.cbm (Commodore Business Machines),
since that's the main group for C=64 folks. ;^)

Good luck!

You'll find that if you'll replace your 6520 PIA with a 68B21 from
http://www.jdr.com for $2.89, it will start working again. The older
PIA's must have been a bit defective but that has fixed two 800s here
with your same exact same symptoms. I've never seen similar symptoms
on XLs or XEs - just 800s, a strange bit of business.

I hate to ruin your day chris, but NO computer ever had a "Gaming Chip", so I take it the guy was taking you for a ride. There's a few things you can try out yourself to narrow down where the problem is, but if you've only limited electronics knowledge, there's not alot you'll be able to repair yourself. Test 1: Is the power supply working? Does the Power LED light. If so we can elliminate the power supply. 2. Does the computer react in any way when turned on? A Beep or similar? If it's beeping or reacting some other way, then it's most likely the TV Modulator that's died. Test 3. Is the processor running. If you put your ear to the bottom of a home computer, you can hear it working. Is this the case, or is it completely lifeless? If it's completely lifeless, it's probably the 5V regulator that has died. If you can hear the computer, then it's back to the TV Modulator... I'd suggest you seek out an electronic hobbyist in your area, who can probaly get it up and running again. However, a lot of the Chips used in the C64 aren't available anymore, so you may have to buy a second one for the spares anyway.

Yes but...

I thought there was a hack for equivalent functionality like this,
something like a switch that hooks into the cartridge present pin and
machine does a 'someone pulled the cart' reboot w/o having to cycle the
power. Then it becomes a matter of making an internal memory upgrade
like a Newell 1meg or one of the SIMM ones.
> Plus you get a built in printer port and RS232 port which goes up to
> 19200 Baud.

I haven't used it in years but I seem to recall APE with a SIO2PC cable
lets you use a PC's modem and printer port. Probably results in a better
connection since you have 56k serial ports/modems with 11 byte buffers.
The 6551 as is used in the MIO only has something like a 2 byte buffer

so its less forgiving. Steve said you can even use a SIO2PC cable hooked
directly to a modem/PC serial port if you use the RVerter handler. I
don't recall the maximum speed of the RVerter handler but I would bet
~19k wouldn't be a major problem to add.
> Not Fast compared to todays computers, but in the day it flew.
> And of couse the 50 pin Hard Disk port.

I don't have a real problem with Scuzy drives, even own a few like a
Sequest removable media. I was under the impression that the MIO has
some problems with modern drives in that they won't format 256 byte
sectors. => forces you to a limited set of older drives.

Not that any of this is a real problem depending on where you live. I
live in the SF Bay area and there are surplus electronic shops with
racks/boxes of old drives for sale cheap.

Hehe, I was the one that loaned my SDX cart. It was 4.19 which doesn't
work well with SIO2PC software or fit in a 1200XL cart port so I seldom
used it.
>
>
> I'd like to see the MIO re-made with some good upgrades. Or a similar

I'm not the most up to date on rumors but the Atari clone VCS supposedly sold in the 100k's. I think Kurt Vendel was a major player in the original and what will be a next generation device. I almost feel like sending him a wish list of things I would like in it or be able to add. Mostly I would like to see things added on silicon.

For instance sync timers registers so we could use a wider variety of monitors. Right now if we modify clock speed we lose vertical sync and the monitor goes nuts.

Faster dot clocking ANTIC and GTIA and the abiltiy to put more then 8k of video memory on screen w/o having to resort to tricks. Eighty column video text in B&W is good'nuff to get me interested in parting with $$$. Anything else like a double res gr. 15 or a VGA monitor is a bonus.

While they are at it go with at least a 10 byte buffer in POKEY and bring the connection out. Doesn't have to be much, just an edge card type connection on the PC board so it doesn't add to cost.

I wouldn't need a faster processor if they would add the 65C02 instruction set as a minimum. I have one of these in an old 800 and in my experience it can make ~5% tighter code. => an OS rewrite would mean an extra 800 bytes of code available for enhancements. They would need to use flash memory or an EPROM for it to work.

A second PIA chip an have it brought out as an IDE interface would be nice. Once again just an edge card connector so the 10-20 they sell to 8-bitters doesn't get passed on to the thousands they sell to the pedestrian users.

Uh, there is no "gaming" chip in the C64.

> When it happened again the same guy tried
> charging us double and wouldn't give us the keyboard back without

Not a good guy.

> The same problem exists after trying the keyboard with two
> different monitors and disk drives. My questions being:
> Did I get screwed on the deal?

Yes.

> What exactly could be wrong?

There are many possible items that could go wrong in the C64.

> Is it possible to fix without buying another keyboard for replacement parts?

It's possible, though with C64's going for so cheap, you'd really
have to love your current one to get it repaired for a price. To
demonstrate how cheap C= machines are, at our table at last weekend's
Vintage Computer Festival, we had C64's for $5 and C128's for $10.

Truly,
Robert Bernardo

4052. LARGEST COMPUTER COLLECTION UP FOR AUCTION...RIGHT NOW...570+ computers

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-11 22:08:34 UTC
From: "Dimitri Kokken (info@fki.be)" <dimitri.kokken@pandora.be>
Message-ID: <pC8df.27934$rA.10117@blueberry.telenet-ops.be>
Source record: 9409

Hi there,

if you're an old computer collector I'm sure you'll be interested in the (probably) largest old computer sale EVER. Over 570 old home computers are up for auction at
www.mo5.com/dimitrisales/
All you need to do is register (it's free and done in 20 secs) and then you can start bidding. If you want to have a look at what's up for auction without registering, that's possible too of course, just click here then :
http://www.mo5.com/dimitrisales/auctions.php?tri=4&limite=533
Some very very very rare items are up for auction, the most famous one probably being the Commodore 64 GOLD WITH commemorative plaque!!!
But there are many other fine items, if you're a collector, I'm sure you'll find them quickly enough :)

Right now, 145+ collectors are already bidding...so don't hesitate or you'll be too late!
ALL AUCTIONS END DECEMBER 4TH 2005

Oh...if you want to see pictures of the collection, go here :
http://users.pandora.be/F-242/Computers/NewPics-25-10-05/
And if you want to see the complete list with direct links to these pics (not all comps have a pic yet) go here :
http://users.pandora.be/F-242/Computers/Computer-List-Dimitri-with-picture-links.htm

That's about it...good luck if you intend to bid.

Dimitri Kokken,
Belgium

I was considering the idea of combining some of the items into a more or
less complete system, maybe including some old PD software.
Set someone up with the ability to put the machine together, hook it to
a TV, and play some disk-based games right out of the box, for example.

In any case, this project has to go on the back burner for a while.
Personal issues have risen, and I must spend my time dealing with them.
Maybe after the first of the year...

Hi,

I've just picked up a boxed Atari400 (UK PAL) from a carboot sale here in the UK.

Switching the unit on give a 'Atari Computer - Memo Pad' and a block cursor prompt.

Does it need a Basic Cartridge or is Basic built in on ROM? What commands are available from this prompt? The computer came with an Atari 400/800 Basic Reference Manual but no User manual. Is there a copy of the User Manual online?

Can anybody give me some indication of what it's value would be? I'm not indending selling it. I plan to make some use of it for a while.

Any info greatfully received.

Cheers

Hi!

Memo Pad has no commands available. You do need the Basic Cartridge.

Not too sure about the value of the manual. I have Basic cartridges to spare if you are interested. Send me a couple of lines and we might agree on something.

Take Atarian care

Hi Vidar,

I've just won a Basic cartridge on Ebay on a 'Buy It Now' so I'm pretty well sorted on that now thanks.

As regards the valuation, I was after a valuation for the boxed 400 and not the manual. After re-reading what I wrote earlier I can see why you thought I was after a valuation for the manual. My fault.

Cheers

Hello world.

I'm looking for someone that successfully browsed the Internet using
Contiki in his/her 8-bit Atari.

I already did it, but it was hard to find a good SLIP/routing
configuration on my linux box, and I'm trying a more simple config.

Did someone try conecting the 850 to a Windows PC with SLIP and routing
enabled? Which version of Windows and/or programs were used?

Thanks in advance.

The fatal flaw would probably be that you need to cmp #$01. What your
code does is compare against the contents of zero-page locations $01 and
$02. It's a common beginner's mistake, and not unheard of from
long-time 6502 (and 6800 and 6809) programmers, too.

LOL! Sometimes hard to track down too! Well, I never said I was an expert
assembly programmer! ;)

Hopefully the person who asked the question didn't use my code and jump off
a bridge in frustration when it didn't work!

true no cart port, but I guess being a XEGS it would be difficult
(since the cart is on top where the keyboard is. Also the XEGS doesnt
feature a PBI/ECI port, so that kind of expansion is out, but c'mon
you could load that baby up with almost every game for the 8bit and
take it anywhere!

Yea, grey or even silver/black like the 800xl would be cool.

4079. Recommended resources for learning how to program A8 games

I suppose you're looking to go first rate by programming in assembler. If you are new to
any type or programming, it would be difficult to use assembler. Since Atari BASIC is
in your XL/XE computer, you could get started right away programming a 'Hello World' program
in five minutes.
Having the idea that you express for a game is, like, the strategic end of programming, and
the seed for where you want to go. Getting there might best be done in small steps.
I recommend 'Mapping the Atari' for lots of useful information. 'De Re Atari' is also useful.
A good way to learn would be reading ANALOG, and maybe Antic magazines, which had
source code in BASIC, and assembler.
Good Luck

Thanks for the responses thus far. I have been frequenting Atari Age for quite some time now and I am also familiar with the books that were mentioned. Basic probably is a good place to start for programming. I have no idea. All I am really looking to do is to get some what good at coding games for this system. I have a few ideas and I really want to try my hand at programming. Does anyone know if there are books, websites, etc.. that specifically cover this topic? I am looking for study references that specifically cover coding games for the Atari 8-bit computers.

> otherwise I'd be at all the cool 8-bit scene events in Europe ;))

A female coworker of mine has a sister in the USA. So we checked out
the prices for flighing to the US from the Netherlands one day. We
found out that flighing to the USA and back is cheaper then flighing
from one city to the next within the USA.

So what's stopping 'ye? ;-)

Was there a voice chip or a modem in there? I seem to recall that
either of the two uses the same address range ($D6xx). For those to
work with the Blackbox you'ld have to make both willing to share those
addresses.

Hi
I am new to this so I hope I am in the right place, I have just got
hold of an Atari 800 all I get is a yellow screen on turning it on, can
anyone tell me what to do, is it repairable or is dead.

THANKS

One Book I would recommend if you are new to programming on the
Atari 8-bit is called, "Your Atari Computer" "a guide to Atari 400/800
personal computers.

It has well over 400 pages of really good info and program examples.
It will get you started and take you thru Advanced Graphics and Sound.

There are also photos of various Atari Hardware.

When I was learning about Player/Missile Graphics, and
Sound, this Book was the one that helped me the most.

There are alot of good books on the subject, but I think you
will find this one very useful if you can find a copy of it.

It doesn't cover the XL or XE, but everything in the book is
related and all program examples will work on these 8-bits.

Compute! Magazine also did a few good books on various
subjects of programming the Atari 8-bit.

"De Re Atari" is another good one. Might be hard to get ahold of unless
its online somewhere.

Also" Mapping the Atari", and the Updated, Mapping the Atari that
includes info on the XL and XE.

I've seen some of these come up on E-Bay from time to time.

Anyone have a original, The Eternal Dagger, game with original box,
manual, and disks, for sale or trade?

I have a copy of it all, but would like to get it all original.

It was made by Strategic Simulations (SSI) and was a followup to
The Wizards Crown, one of my personal favorites on the Atari 8-bit.

Contact me in e-mail if you happen to have it for sale or trade.

Source record: 9300

I have been reading a few of the books listed on atariarchives.org.
Considering that I know nothing about programming, I must admit that I
find these texts rather intimidating. It would be great to find a few
books that introduce the reader to beginner programming by outlining
the steps for creating games. It is also quite obvious that this is
complicated not so quickly learned subject and would likely take months
if not years to get really good at. Basic seems like a good place to
start.

4094. Temple of Apshai and Sequels

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-17 02:58:38 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <mjSef.1684$cd1.1161@bignews5.bellsouth.net>
Source record: 9301

One of my all time favorite games is Temple of Apshai and the
sequels.

I have a full original "Temple" on disk and cassette.
And have most all the sequels and expansions,
but they are disk and manual copies.
I do have the original Manual for Temple of Apshai
Trilogy, but Disk is a backup.

I would like to find the following all original with Box, manuals,
and disks.

HellFire Warrior
The Keys of Acheron (Hellfire Warrior Expansion)
Upper Reaches of Apshai (Temple of Apshai Expansion)
Danger in Drindisti (HellFire Warrior Expansion)
The DateStones of Ryn (Don't have this one at all)
Morloc's Tower (Don't have this one at all)
Sorcerer of Siva (Don't have this one at all)
Temple of Apshai Trilogy

Most of the above titles are listed in a old EPYX catalog that
came with Temple. Except for Danger in Drindisti. I didn't
know about this one until someone sent me a copy years ago.

Would like to know if there are any other expansion disks or
a new title in the Old, Dunjonquest Series by EPYX.

Temple was the first Dungeon type game I played on a Computer,
a friends Atari 400. That was years ago, when it first came out.
I still have the old characters we made up on disk and paper.

Damn, those AntMen were pesky creatures!

I never took time to finish the HellFire Warrior Series.

Anyone still have some of these in original condition?

> start.
OK, start with BASIC. The recommended
'Your Atari Computer' by Poole and McNiff
has a really useful listing of all the Atari BASIC
commands, at the end of the book.
The first few chapters give you easy programming examples.
I remember my first program was from that book, did a marquee type ASCII
graphics.
You can do just about anything with Atari
BASIC. Lots of people use it, even for commercial programs, which is
sometimes
compiled. You can get the game going,
then use BASIC machine code USR routines
for parts that are slow.
Just starting out, it is fun to just write a
'Hello World' program:
```
10 ? "Birdie3 ";
20 GOTO 10
```

Luck

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I think a black and silver model would be cool. I always thought the
XL series looked the coolest and the 800xl seemed to represent the
8bits to me back in the day, altho I always like the 1200xl the best
(and still do) cosmetically.

IIRC it was Paul Alhart who published a neat and cheap alternative in AIM magazine way back when. You lay two SIO cables side by side and strip about a foot of cover off each one, starting about 8 inches from the paired ends, uncovering towards the center. You then bunch the foot of uncovered wire together so as to expose/create a large ball of wires on each cable. You then find and combine each color of wire with a few tight twists. Then at each twist, you apply a soldering iron to melt away the insulation, apply some flux and then solder the same colored wires together. Make these connections all along the way of the bared one foot of wire such that no connection can touch any other. Tape each connection with electrical tape, then tape the whole bundle leaving out the ground wires. I cut the ground wires in the middle and fold them back to then wrap the main portion with aluminum foil and integrate the ground wires into the foil on top and soldered back together followed up with a good wrapping of tape.

You can't beat the price or availablity. The utility of such a four headed cable will amaze you once it's built. Use the two short ends (8 inches) for your disk drives with the long ones used for your computer and Atari printer. You now have three open ports to link everything else with.

The only problem is when the color of the wires are not the same, I never ran into that situation though. Chances are good they will be matched which is something you should double check before soldering the first wire?

I was in need of just such a critter when I got that AIM issue, thanks Paul, you saved the day. It's a bit more work than it sounds, but it's well worth doing.

Message-ID: <1132345267.289990.276260@g14g2000cwa.googlegroups.com>
Source record: 9315

I was going through my old stuff and came across my original Atari 800 Rev A ROMs! So I put them back into my 800 (orginal owner since 1979) and made a quick dump using Action! What I have is OS Rev A, the North American NTSC version, which I understand is quite rare. At least the dump is rare.

The ROM image seems to work fine in Atari++ (1.44 for Windows) and Atari800Win Plus 4.0 Final, though the latter complains about the checksum (proabably because NTSC Rev A was unknown until now).

If you are developer (or just want the ROM image) just Email me and I'll get it to you. Please use the subject, "800 OS A".

My Email address is pretty easy to figure out from the message headers.

Yeah I want one too. It would be great if they want into production. Is this the same guy that made the portable Atari 2600 that was shown at one of the CGE in Vegas? I was there and saw it. It looked super and ran like a dream.

I like the wood grain myself. Where can I order one? <g>

4112. Atari800Win Plus versions

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-19 19:17:40 UTC
From: russg <russgilb@MUNGEsbcglobal.net>
Message-ID: <oTKff.762$Ba6.186@newssvr30.news.prodigy.com>
Source record: 9319

I find that a800winplus 3.1 is more stable than
the final 4.0 version, at least on my XP computer, Win98SE seems to like 4.0
fine.
Anyone find instablility in 4.0?

4113. Re: Atari800Win Plus versions

Source record: 9320

I'm a Win98SE user.

I found 3.1 slightly more stable than 4.0 Final. I did have problems with saved states and one of the 4.0 betas but I can't say which one. No apparent such problems with 4.0 final, but then again I haven't played many games, and therefore haven't saved many states, since going to 4.0.

OT:
I can't change the color saturation from within 4.0. I can change the value within the Pallette menu but nothing actually changes.

I can't load a binary file from the H: drives using MyDOS (vers. 4.53/3 or 3.19). I can using any other DOS.

Stephen Sheppard

I believe that's a burl finish which is classy (IMO). Woodgrain (you
know with lines) is tacky.

I wish all laptops had this much style.

Amazing craftmanship!

Wilson gets 37 months for porn charges

Date: November 3, 2005
Publication: Herald & Review (Decatur, IL)
Page: A3

URBANA - Travis Wilson, 28, of Decatur was sentenced Monday to 37 months in prison by Chief U.S. District Judge Michael P. McCuskey in U.S. District Court, Urbana, after he pleaded guilty to possessing child pornography. Wilson also received three years supervised release,

was required to submit to a DNA collection and must register as a sex offender.

Charges were filed after an investigation by the U.S. Bureau of Immigration and Customs Enforcement, Decatur Police Department...

Decatur man arrested in child porn investigation

Date: May 28, 2005
Publication: Herald & Review (Decatur, IL)
Page: A3

DECATUR - Bond was set at $75,000 on Friday for a 45-year-old Decatur man arrested a day earlier by local and federal authorities for investigation of possession of child pornography and disseminating it via U.S. mail and the Internet. The suspect remained in the Macon County Jail late Friday afternoon. Formal charges have not been filed.

Decatur police were proceeding with the case against the suspect, but federal authorities could decide to step in and take over the case for...

Yep, voice and modem circuits. From what I recall now when I looked into it there were differences with the way the Black Box / MIO used the $D6FF memory location than the Atari parallel bus devices.

Atari had used specific bits at that address to enable the mapping in the code for specific parallel devices in the $D800 - $DFFF region. Since these devices were only unique to the 1400XL / 1450XLD / 1090XL and were not marketed then the makes of the Black Box and MIO made use of the $D6FF region for their own use.

Huge bus conflict occurs when trying to use the Black Box with a 1400XL and 1450XLD.

CSS had both a regular and deluxe (switched) Quintopus. The switched Quintopus is very handy if you have some incompatible hardware on the SIO chain. And you might also check at B&C ComputerVisions -- IIRC, they sold a couple of multi-port SIO attachments, and one of them could be powered. -Larry

A very popular feature of the MIO was the 256KB/1MB ram for ramdisk(s), etc. But according to the docs, the KMK-JZ interface will control two IDE devices -- a Master and Slave. Has anyone set one up with a regular drive as the Master and a compactflash as the Slave? This would pretty well simulate the MIO interface + ram feature, especially since the CF is non-volatile. Has anyone timed a compact flash with this interface to compare against the MIO ramdisk? -Larry

Hi,

It has been over 15 years since I last used an atari (ran a BBS in AK with an 800 and 4 drives daisy chained to it for about 3 years). At one time I had a 400 (which I used for modeming out), an 800 running a 24 hour BBS, a 600xl and a 1200xl that I used for programming / playing games on. I have been tinkering with the emulator Atari800Win, but recently all my old 8bits have been my 1st computer I owned, the little Timex Sinclair 1000 (host a support site for it at www.ts1000.us).

I have been trying to remember a program I had at the time that gave you 80 columns of text on the 8bit using Graphics 8 that you could use with your basic programs. Does anyone know what the software name was?

Bill H

IMO the 1-chip 14C89 SIO2PC is the easiest to make (see link). It's not compatible with my SWP ATR-8000 but it works great with my PC using Hias Reichl's AtariSIO.

My 14C89 SIO2PC interface is built inside my 800XL. I've also built an external interface based around the MAX-233CPP IC. It was also easy to build (relatively for a NOOB like me) but it has about 8 more solder points than the 14C89 model.

Steve Sheppard

I remember one called col80.obj or .com.
There is a col80.arc around that contains the
executable and a doc file, I think.

4129. Classic Computers

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-24 01:55:12 UTC
From: Pixie <spam@yahoo.com>
Message-ID: <43851d85@news.eftel.com>
Source record: 9336

Hi,

Please forgive me if this is seen as spam or if you've seen this before, but
I thought people here would be interested.

I have printed and produced some classic computer wall calendars for 2006.
You can see it and purchase them online at:
http://www.digicraft.com.au/calendars.

The calendar features the Atari 800XL.

4130. DOS replacements

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-24 04:52:03 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <FDbhf.9626$KP1.1258@bignews5.bellsouth.net>
Source record: 9337

Greetings,

There are quite a few DOS replacements for the Atari 8-bits.

I was looking thru some stuff and found a TOP DOS 1.5 Disk and
Original Manual. Looks fairly good.

How does this DOS stackup as a replacement for DOS 2.5 over
other replacements?

Also, in my disk collection I found a Original Disk labled,
SMARTDOS release 6.1D.

No manual that I know of, unless on disk. Anyone know
anything about this one and if it is any good?

>

Sounds interesting. Can you have more than one setup to simulate
more than one RamDisk?

Using a MIO on a 130XE, you can have Several RamDisks at the
same time, including the 130XE RamDisk. Especially with the One
Meg Version.

For example, with a 1meg MIO, you could easily have 4, 200K
RamDisks, a 5th one if using a 130XE type RamDisk and still
have enough memory for a good MIO printer Spooler.

All would be reset proof except for the 130XE ramdisk.
And if you can get along with less memory for ramdisks,
more are possible on the MIO.

The MIO RamDisk is almost like a mini hard drive.

When running a BBS, it is possible to load all the BBS commands
and etc into a RamDisk instead of putting them on a hard drive.

I had BBS Express Pro setup like this, using SpartaDos 3.2D.

When these commands are accessed by users, they load up as
fast or faster than off a hard drive and it saves ware on the Hard
Drives,
because they are loading up from RAM and Not having the hard drive
always accessed for common commands and etc.
Almost the whole BBS could be Ran in a RAM Disk.
Of course you will want to put your large files for downloading on the
Hard Drive. But you could put quite a few small 8-bit utility files,
text files and etc on a RamDisk for running and or downloading.

BTW, What would be the limit of Memory one could put in a MIO type
hardware device for use with RamDisks?

And what would be the size limit of a RamDisk?
I'm thinking this would be related to the Hard Drive partition size?

Could one make a hardware Ramdisk system like the MIO with a total
of say 8megs, and create 4 or 5 1meg RamDisks?
I think its possible myself.

And, Can the Memory in the MIO itself be upgraded to 4megs or more
and work without any software changes to the MIO?

At the time the MIO was made, Memory was very expensive. Now
its rather cheap. I'd love to be able to expand the MIOs Memory for
larger RamDisks.

Don't know TopDOS. I used SmartDOS as my
first DOS, I had to buy it from RANA, to go with
my RANA 1000 disk drive, my first drive.
It is an excellent DOS 2/2.5 compatible DOS,
but double density.
Today, I'd say MyDOS 4.53 or SpartaDOS 3.2g
are the most used. Sparta is not DOS 2/Menu
type, no DUP.SYS, it is command line driven.
Actually 3.2g isn't SpartDOS, it is FTe DOS,
released after FTe bought ICD rights.
The ultimate DOS, I would say, is SpartaDOS
X, which comes in a pass thru cart. I don't
like X, it seems to mess up my disks with its'
ultraspeed.

> >A very popular feature of the MIO was the >
(Forgive the 'snip'.)
I don't think you can upgrade a MIO's memory.
Neither the 256K to 1 meg nor the 1 meg to
higher. The memory the MIOs used wasn't
PC, cheap type, but an odd type that was
expensive and probably not easy to find today.
I loved my MIO, also ran a BBS.
I could boot off it, in fact, I had it set up
to re-install BBS Express on power up, if
there was a power outage, using Sparta 3.2D
batch file.

4135. CC65 development questions

Hi there.

I want to give CC65 a try but since I have used only Basic to develop
on A8s, I have no idea how to do memory management.
What do I have to do to calculate the free memory for CC65 programs.

Bye Jochen

Source record: 9343

I really like Top Dos. I use it when programming mostly, as I just type Q do and the do batfile contains all the programs I want to start in sequence. It starts first with Textpro, then AMAC, then any fonts, music and such to end with my assembled file. Really nice, so I don't have to type L TEXTPRO, L AMAC, L FONT1.OBJ and so on!

Doesn't support Harddrives though, unless you keep it to DD, which I have found works okay.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

You setup the memory configuration of your program via the linker config script. You can set the start address of your program and setup the various code and data segments. There is a default linker configuration script that you get when you compile with the -t atari switch that places your program at $2E00. The short story is that you don't need to do any memory management for simple programs. There is many ways to reserve memory for your program to use, but I'd say the best is to use the linker configuration script and/or defining the structures/arrays explicitly in your program.

The top of memory is calculated based on MEMTOP/APPMHI and the C stack is put directly under this (minus any memory reserverd for graphics modes) and grows downward towards the end of your program.

More information can be found in the documentation at www.cc65.org, specifically in the section on ld65 (the linker) and the platform specific documentation for the atari.

Well, I should have mentioned the fact, that I meant the original CC65
on the A8 itself.

I think that the characters were only 3 or 4 pixels wide - but may be wrong.

Back in my atari BBS days I had a non atari drive, not sure what brand it was. It had an led display on it that showed which track (or sector) it was accessing. The nice thing about this drive was that it had a standard floppy connector on the back that I was able to daisy chain to two 5 1/4 drives I salvaged from a cp/m system I had and to a drive for an Adam computer that I popped open and removed the controller on. I think the software I ran was FoRem (?). I also used another software (BBS Kit?) that let you build your bbs based on "scripts". In it's heyday I was averaging 30 - 40 callers a day (not bad for a BBS that was just messages). Eventually that dropped to only a few calls a day when my ex-wife discoverd how to answer the chat (one of the reasons she is the ex :)). One day I got so tired of it I pulled the board down, plugged a dumb terminal into the auto answer modem and just let her chat with any caller!

Pretty much anything that is tangible has intrinsic value. Corn and pork bellies have intrinsic value. What does intrinsic value mean? Intrinsic value means that something will never have a value of or less than zero.

Stocks, for example, have no intrinsic value. You pay for part ownership in a company through the purchase of stock. Unfortunately, stocks do not have intrinsic value. Therefore, what was worth so much money one day, could be worth literally nothing the next day.

Commodities, however, have intrinsic value. Gold has intrinsic value. Gold will always be worth something greater than zero. Why? Because it's tangible and people can actually hold it and do something with it. Gold costs money to mine. Real work goes into mining and processing gold for consumption and use. This means that gold will always have real or intrinsic value.

While a product like the MIO may have some intrinsic value, many of these devices end up on landfills because their real intrinsic value is virtually zero. Again, not literally zero, but, virtually zero. The simple fact that there is a small group of diehard collectors out there, does not give such devices any real intrinsic value.

But yeah, they do have more intrinsic value than say, a stock certificate.
;)

Speaking of intrinsic value, I went straight from posting that last message, to reading a spam message from Bravo Sierra Computers. As you know, most of the products that Ben sells, he probably gets for free. i.e. the donors have deemed these products to have little or no intrinsic value. The basis for this valuation is the very real lack of demand for these products. It pretty much is not feasible to produce these products any longer.

While they have real, or intrinsic value, the intrinsic value of these products is virtually zero. Do not confuse "collector value" with "intrinsic value" because they are entirely different. Intrinsic value is the real value of the product... and the intrinsic value of MIO is virtually nothing. The collector value of the MIO might be significant, but it in no way represents the real or intrinsic value of the item.

Yes, I know! You're confusing "intrinsic value" with "collector value".
Take a dollar bill, for example. It's face value is equal to an arbitrary
value of one dollar - or one hundred cents. Its real value is substantially
less. A dollar bill has an intrinsic value of almost nothing, but an
arbitrary value of one dollar. But what's a dollar worth?

As for stock certificates, remember the dot com bubble that burst not too
long ago? That was only able to happen because the stocks of those
companies had no intrinsic value. They had no real value. Stocks are
bought and sold on speculation and illusion. They have no intrinsic value.

Ever wonder how the wealth of a nation can be greater than its tangible
assets? It's all about intrinsic value and perceived value. Collectors buy
based on perceived value.

Take antiques for example. The intrinsic value of antique furniture is
virtually nothing - The raw materials have some intrinsic value, but the
actual antique has virtually no intrinsic value. People make money on
antiques because they can get items with little intrinsic value and sell
them at a much higher perceived value.

Two entirely different animals...

Thanks for this!

Is there any simple way of using the extra paged memory (of a 130XE or
expanded 800XL)?

> I have been trying to remember a program I had at the time that gave you 80 columns of text on the 8bit using Graphics 8 that you could use with your basic programs. Does anyone know what the software name was? <

There have been a number of these, implemented in several different forms. COL80 was the first that I recall, published in COMPUTE! maybe around 1982-83. There was a follow-up called COL80XL, since the original was incompatible with the XL/XE lines. Omniview and the XL/XE series of these came next which were replacement 800 operating systems with 80-column drivers built in. Antic published one called EASY80, which was quite good. There were the ACE-80 and ACE80-XL carts that perhaps were the best overall implementations. There was also German (I think) package called SAM (Screen Aided Management). All of these have issues of legibility and speed to varying degrees.

Last, there is evidently an excellent 64 column driver/set. I've seen the results, but don't know any details about it or if/where it can be found. (Anybody?) 64 columns have some definite advantages over 80 columns -- mostly the character set looks quite nice, rather than the "three dots + a space" characters in the 80-column sets. -Larry

No, you are taking things out of context to make a point not related to
my original statement. I never said the MIO lacked intrinsic value which
is what you went on about. Quite the opposite I made the point that has
value to the collector. I didn't say the new stuff has no intrinsic
value without qualifying the statement. I specifically qualified the
statement by referring "to a collector."

It is like saying a new bag of golf clubs have no intrinsic value to a
cat. That is not the same thing as saying golf clubs have no intrinsic
value. It is a logical construct of subset vs. set, i.e. mammals vs.
felines, perfectly valid.

I am sure it was one of the ones you mentioned but I seem to recall the
one I used as on bbs's as N80COL .BIN or .COM. I copied/appended it to a
compiled terminal program I wrote back in the 80s. Worked OK but not a
lot of features and a bit slow. Eventually I wrote my own screen
routines in Action! to get the speed up a bit.

I remember this too but I don't think I ever got it to work. Wasn't
there some constraints on the program where it would only run with
certain software? Something like TextWiz or a terminal program?

I thought a 64 column display would be nice too. I figured the actual
text on a printed page is only ~65 columns wide so it would be
good'nuff. I started writing a terminal program for a proportional front
but when it got time to make a proportional front character set I fell
flat on my face. I'm just not an artist, no sense of style. I never got
the combinations of little letters like 'i to look appropriate with big
letters like 'G so I abandoned the project.

There are no built in functions or anything like that. I have written some basic functions to detect and swap in the memory areas, but you have to carefully build your linker.cfg file and layout your segments so that any code that is going to swap out a bank of memory doesn't reside in that bank of memory itself, or depend on anything in that bank of memory.

There is some documentation on the www.cc65.org site in the Atari platform specific docs on how to do this with the linker.cfg script and some code.

You could build wrappers for your functions that swap the memory out and then call the "real" function in the extended memory area. I've never done that myself, but it shouldn't pose any real problems.

I'm obviously wasting my time trying to explain this to you; I don't think you'll ever grasp the concept here.

How much is a dollar worth? Do you know? Has anybody ever suggested that you needed to learn the "value of a dollar"?

A dollar has no intrinsic value. A dollar has an arbitrary value that is determined by international speculation and trading. Let me give you an example of just how insane world economics is.

Both Canada and the United States each use the "Dollar" as their official currency. In the United States, the dollar is equal to 100 cents. In Canada, the dollar is equal to 100 cents. Can we both agree on that? That's pretty simple, right? A dollar is a dollar dollar, and they're both worth 100 cents.

Is the Canadian dollar and the American dollar equal? No! They're not, are they? Without actually checking current exchange rates, I'll set a hypothetical exchange rate of 80 cents on the American dollar. So, a Canadian dollar, for the purposes of this example is worth only 80 American cents.

It looks something like this:

One Canadian dollar equals eighty American cents.

So how much is a dollar worth? Well, to answer that question, you're going to have to ask how much a cent is worth. How much is a Canadian penny worth? Ya know something? A Canadian penny and an American penny are equal. One cent is one cent -- no matter how you slice it.

So it looks like this:

One Canadian penny is equal to one American penny.
Both the American and Candian dollar are equal to 100 cents.
The Canadian dollar is equal to 80 American cents.

Doesn't make sense, does it? Nothing in economics makes sense. That's why no one understands economics and every economist disagree's with every other economist.

Lets expand this even more. How much is a dollar worth?

If I go to the convenience store on the corner, I can buy one can of Coca-Cola for exactly one Dollar. Therefore, my dollar is worth one can of Coca-Cola.

If I go a little further down the street, I can get a can of Coca-Cola out of the vending machine for 50 cents. Therefore, my dollar is worth two cans of Coca-Cola.

In theory, I should be able to buy two cans of Coca-Cola from the vending machine for a grand total of one dollar, and trade them in at the convenience store for two dollars. Right? The convenience store owner has arbitrarily determined that a can of Coca-Cola has a value of one dollar, while the vending machine owner has determined that the same can of Coca-Cola has an arbitrary value of just 50 cents.

So, what is the value of a dollar? What is the intrinsic value of the dollar? The dollar really has no intrinsic value, does it?

What is the intrinsic value of a can of Coca-Cola?

Well, let's pretend that it costs the Coca-Cola company exactly 7 cents to produce one can of Coca Cola. Well, if it costs the Coca-Cola company exactly 7 cents to produce one can of Coca-Cola, it can be said that the can of Coca-Cola has a real, or intrinsic, value of seven cents. Why? Because that can of Coca-Cola can not exist for less than 7 cents.

If the convenience store owner sells that 7 cent can of Coca-Cola for one dollar, and you buy it for one dollar, does that mean that the can of Coca-Cola has an intrinsic value of one dollar? Absolutely not! The intrinsic value of the can of Coca-Cola remains 7 cents -- Even if you pay a dollar for it!

That is the first 'almost correct' statement you have made. I understand
your explaination perfectly. It is just that it is out of context, as
such in error, and lacks relevance to my point. I understand concepts
like alien abduction, I just don't believe they are valid.

FYI -- if you have thought about trying a CF "drive" with one of the IDE adapters, you might check your local Kroger store. Our local stores have 32 MB Sandisk CF cards for $4.99. Not big, but these will be my non-volatile "ramdisks" for my setup. Cheapest price I've seen by far for new cards. Let's see -- milk, bread, eggs, CF, ... :-)

4162. CX481 The Entertainer

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-27 16:20:06 UTC
From: Michael Current <hunmanik@earthlink.net>
Message-ID: <oqmjo15dkauese6veps5pkg8en57lf4rqu@4ax.com>
Source record: 9369

It seems there's something of a storyline concerning the second software title included in the CX481 The Entertainer kit. I've just updated the FAQ about it like this:

CX481 The Entertainer (Star Raiders + (Computer Chess or Missile Command or Pac-Man) + 2 joysticks). Atari computer product catalogs first mention Missile Command, then Pac-Man as the second game. Text on the box itself (thanks Bill Demian) indicates Computer Chess as the second game. The illustration on the box actually shows a Music Composer box underneath the Star Raiders box.

I was just wondering if anyone knows any further details. What was the 2nd title that came with your The Entertainer kit? Did it match the 2nd title mentioned on your Entertainer box? Did any Entertainer kits actually come with Computer Chess (seems possible to me), or even Music Composer (I highly doubt it)?

Thanks,

-Michael

:(
No Kroger Supermarket in the Northeast (USA) Looks like midwest and
southeast plus Texas only..

Cheapest I've seen around here for 32MB CF cards is about $15.

Q: Does Compact Flash have unlimited read cycles?

Virtually, yes. Sandisk CF cards also do error
correction within when bits have been written to
beyond their limits, so as long as they are not
filled to capacity, they should write for quite
a long time as well. Actually, they have spare
bits, which is why they don't format to full size.

I like how on the video he made he picks up a current compaq computer off
the desk and he says "What is this?" and appears to toss it to the side where
you hear a crashing sound. Then he puts down the XEGS laptop and says "Now
THIS is a laptop".

Wonder what the battery life is like on that laptop?

FamilyNet International Newsgate

Well 80 column anything...

Currently using Ice-T 2.72 on the 800xl (ramboed) and that is really nice.
There were 80 column cards for the Atari 800. The Franklin card and I
believe there was 80 column editor by Omnimon.

I also have a 80 column reader. If you have the XEP-80 module you get 80
columns on another display. You could use that at 4800 buad with bobterm, and
other allication (accounting, etc)

Or just work at it normally on the Atari computer and see the 80 column
effect when you print it on the printer. That is what I did back in the day.
:)

None that I know of. Just checked the board and its up/online.

What kind of message did you get? If it was "connection refused" then its probably because of one of 2 things:

1. Another user is online (unfortunately, the software is single caller).
2. Its the top of the hour, when a script runs and checks if maintenance has been done in the last 24 hours. If it has, it goes right back to the online status. About 30 seconds or so. If its after 12am, and maintenance has not been done, then one of several scripts may run, depending on whether or not its time for daily, weekly, or monthly maintenance. Worst case, it might be 15-20mins. Thats why it runs after midnight, when caller volume is the lowest.

If you get a "cannot connect to blah, blah, blah" then the BBS is probably down, or offline while that lazy good-for-nothing Sysop is fiddling with something. :-)

The MAE assembler had an option to display in 64 columns, that's the
only 64 column display I've ever ran across. I assume one would have
wrestle that code out of there in order to use it outside of the MAE
environment, but I haven't run MAE enough to know either way for sure.
IIRC it was a LOT more readable than IceT's 80 columns but since then
I've graduated to a monitor cable so even IceT might be readable these
days. My problem with MAE is that it takes over your expanded memory
for it's own use when you want it set up with the bells and whistles
and I want that memory for my ramdisk only.

The pages look different, but that may be them..

Either way, its another source for stuff :) Ive about given up on ebay
(between the stupid prices and getting screwed).. And the local area has
dried up totally.

This site came up in my "googling" search

http://www.vintagefunworld.com/

I know nothing about this vendor but perhaps it's the one you are
seeking. Vintagefunworld claims Anacortes, Washington as its home.

Regards,

Steve Sheppard

wow, thats it.. now why couldn't i find it via google... grrr..

I have the same trouble with Microsoft's technet. Cant find a damned thing,
but my programmer gets hits all day long..

tks!

Finding vendors... no problem.

It's trying to get useful information that's pain in the butt.

Hope you find some fun stuff!

Steve Sheppard

Goes without saying, the xbox of course, it won't run either M.U.L.E. or
Lords of Midnight :-)

Come to think it, was there a conversion of LoM for Atari ?

No, but you can emulate a speccy on a ST or better.

Besides the best 8 bit game was Alternate Reality, closely followed by
Star Raiders of course. ;-)

4196. Connecting 8-bit to Falcon

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-30 08:17:53 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <ycdjf.34915$s92.3710@bignews6.bellsouth.net>
Source record: 9153

A while back I stumbled onto a Web Site that was in German.

It had pictures and diagrams of connecting an Atari 800XL to an
Atari Falcon 030. I am not sure what the purpose was as it
was in German. But it looked very interesting.

However, I have lost that URL, and haven't been able to find it.

Does anyone recall seeing this Site and or possible have the
URL for it.

If so, post it or send it to me in e-mail.

Thanks,
phantomm@bellsouth.net

4197. SIO2ST?

Newsgroup: comp.sys.atari.8bit
Date: 2005-11-30 08:32:39 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <pqdjf.34916$s92.18080@bignews6.bellsouth.net>
Source record: 9154

Most of us have heard of the SIO2PC.

I have one of these my self.

Was or is there a SIO2ST similar to the SIO2PC board?

If so, I could use any info about it, A URL and or place to get it.

I do have the X-Former Cable and Software, that allows one to transfer
8-bit files to the ST. I have put together, some of the best software
and it
does work quite well. Although some of the software didn't work that
well.

That was the reason I took the best out of different versions of
X-Former and
mixed in some other software. I can now easily transfer 8-bit files
straight to
ST disks in the 8-bits normal file mode.

And with a 8-bit emulator running on the ST, one can access the 8-bit
files
straight from the ST disks, without having to de-arc them or use some
type of compression. The files will run straight from ST Disks.

However, I would like to know about the SIO2ST if it exist.

I did find a site where the X-Former Cable could be modified to work
on a PC. Only a few wires have to be changed.

It is on the X-Former Site if I am not mistaken. Just Google for
X-Former if interested.

Xbox360 - will never buy it - Burnt once with an Xbox - will stick to
the Gamecube (and nintendo)
Spectrum - not enough experience with it to say one way or another

so

Atari vs C64

Atari 8bits hands down beat the C64. Better graphics, better sound,
better basic (with the exception of the screwy DIM statement), better
expansion etc. When using the C64 it just felt like it was cobbled
together by a commitee and then given to the programmer to figure out
how to make it work.

Well, if you think about it....
The Xbox 360 costs microsoft over $100 for every model they sell...
Their goal is to recoup these losses on games...
But, if you bought it, installed linux, and used it as a quite powerful
little server or desktop box...
Well, that's depriving them of their recouped losses, and the more people
who do that, the more trouble it causes them.

Better graphics? Better sound? My favorite game is Trolls &
Tribulations which was hands down much better on the C64 than the
Atari. Same with Spelunker. Even some of the Atarisoft titles were
better on the C64 than the Atari. Strange, but true!

Cobbled together - true. Left to programmers to figure out how to make
it work - true again.

But I guess for a machine that was quickly put together and nobody knew
how to use, it did pretty darn good in the marketplace.

Now, back to the original thread -- best doorstop - the Timex Sinclair
- after all, its shaped a lot like a wedge.

Linux vs Microsoft - who cares! That debate is tired and worn out!

XBOX 360 - got one for my son for Christmas. Lets not forget that
these systems will be the Commodores and Ataris of their generation.
As long as he's happy with it, I don't care if its made by Microsoft,
Sony, or Nintendo - it's what he wanted. Besides, what's wrong with
having them all? Some games are just better on specific platforms --
why not play the game where it's best?

Not better, other. The Pokey does strange effects, a SID is not capable
to do ... Vaccuum-Cleaner (Out-of Phase) and more. Four Channels!
No Filter :-(

The SID is maybe more virtous but can be lousy to irksome. Depends to
the Composing and choice of instruments.

GfX. I would not say the Atari Chipset is better or faster then the
C64. The VIC is not so bad, though i prefer Antik.

Best Regards,

Daniel Mandic

P.S.: Only beaten by a Sinclair Personal Computer! Depending Colour
choice and High-Res Mode. Who cares about Sound, today 24bit
PCI-Express Soundcards are only snot for me :-) compared to a well
recorded Record.

XBox... Whati¿½s that?

> > Atari 8bits hands down beat the C64. ... better sound

That must be why no-one has heard of the SID chip. Oh, wait. Everyone knows that the C64 music was the best of the 8-bits and the SID was voted as one of the most important chips ever made by Byte magazine and people are still making re-mixes if C64 tunes because they were so good.

>cobbled together by a commitee

No. It was Bob Yannes and a few other people. They were left to pretty much do what they wanted. Definitely not a commitee.

Anyway, the original question was about door-stops, not what is inside. The Spectrum is clearly the best for that as it is the correct shape and has been used many times for that exact purpose. The Commodore employees used to use them (or it might have been ZX-81s) as door stops. A prototype C128 got its Z80 chip from one being used as a door stop :-)

Interesting that the C128 got its Z80 from the Timex Sinclair. I always thought if you painted the C128 black it would look like either:

A TS1000 on steriods

or

A sterile hybrid from an illconcieved mating of a Vic 20 and a TS1000

Still - more software was written for the ZX81 / TS1000 than ever was written for the z80 mode of the C128 (and this does not include the CP/M software - that existed before the 128 was made).

All that aside. I actually liked the look of the C128 - must be hybrid family resemblance slipping through.

On a slightly different topic. Has anyone ever considered using the C128 z80 side to write a ZX81 or even Spectrum emulator? May go a long way to mending fences... (in the back of my mind I hear Yoda "Dark side of the force, powerful it is"

> But, if you bought it, installed linux, and used it as a quite powerful
> little server or desktop box...

I really don't see the point why I should spend $400 for an underpowered
machine with hardware problems. An XBox is a nice game system, but most of
its power (The whole CELL architecture, for instance) is rather pointless
for a server. For $400, I can buy a PC which is *much* faster than an
XBox-360 _for desktop and server use_.

Apart from the fact that it won't be a quite powerful little server (it'll
be a rather crap and underpowered little server), nor a nice desktop
box (It's severely underpowered for that), is "Microsoft is losing money
over it!" really a valid reason?

"Hey, if I pay $400, Microsoft will have to shelve out another $100!". Somehow
that doesn't strike me as a solid business plan, if the goal is to make
MS bankrupt.

> Well, that's depriving them of their recouped losses, and the more people
> who do that, the more trouble it causes them.

Right now, my bank account will miss that $400 a lot more than MS's bank
account will miss the $100. It kind of sounds like "Hey, I don't mind breaking
my legs, as long as you get a black eye during the process"

It's overheating due to a faulty heatsink. This probably isn't the
case with European machines. Most of the machines are crashing inside
store display cases - why? Because they're badly ventilated. Also, the
poll that claim 16% of machines are broken is hogwash - because people
with broken machines are more likely to add to the poll and register
their disgust than people with working machines. There haven't been
any reported problems with consoles not working on startup, as far as
I know.

Not right at startup but after only one game (in a well ventilated room!)
my daughter's boyfriend's 360 started flashing all red indicators and
refused to
work at all after that. He called the toll-free number and had to wait 45
minutes
to reach someone at MS. The guy there said they were being swamped with
calls about dead units. No one listens to me when I tell them to wait a
month
or two to let other people work out the bugs. If you want the actual
figures on
360 mortality, buy at least one share of MS stock. They have to tell
shareholders
the truth by law (at least in the US).

Oh, Spike's not a sniper, he's an old net friend in these Speccy parts, but I do
agree that the "costing Microsoft $100 for every 360 sold" is nonsense.

The original XBox only lost MS $40 per unit at the $100 price. And that was
simply done as a tactic against Sony to gain market share fron their first
console. now they have that share, they are being more money-wise. they will

clearly make a profit from each machine until such time they price match Sony's PS3 in the future.

But the damage to Sony has already been done, by getting there first with the next gen consoles. MS will have an almost clear 6 month headstart on Sony with the 360, and with the already successful Live service and ever increasing backwards compatibility that the 360 provides will only hurt the not-entirely stable company that is Sony.

Ha ha. This is a better troll than the original post. The C64 is STILL
light years ahead of anything Atari ever made.

Indeed. I think people writing RPG games today should be required to
look at AR before they start coding. I still count it in the top 5
RPGs I have played and its 25 years old! The level of immersion is
just something you do not see today.

You're high.
> Better graphics,
This is demonstrably false, and I suspect you are relying on people not having knowledge of both platforms.

The Atari 8bit hardware modes are severly lacking by comparison to the C64. I use the highres mode as an example:

C64 Hires = 320x200 with 2 colors PER 8x8 cell (from a pal of 16)
Atari Hires = 320x192 with 2 colors PER screen, sharing a HUE!

And then there are the software modes, of which the C64 has legions, but I will name only two of the simplest that both defeat all of the Atari software modes that I know of:

C64 FLI = 16 colors in 136x200
C64 IFLI = 256 possible colors in 160x200

Atari APAC = 256 in 80x192
Atari Colorview = 4096 at 80x192 with terrible rolling
Atari HIP and RIP suffer from is inferior with

>better sound,
Not by a long run, though I suspect this has more to do with the coders on that platform than the hardware itself. After all, it does have one more "channel" than the SID, though the POKEY's 4 "channels" are not nearly as independent of one another as the SID's "voices".

The SID has ring modulation, the POKEY does not, for example.
Put simply, while the SID could emulate a POKEY's sound, a POKEY could not emulate a SID's sound. It simply lacks the features.

>better basic
This is more a matter of opinion, though the C64 has a quite powerful BASIC, and didn't need to load it's DOS from a disk. The Atari BASIC had some graphic commands similar to BASIC 7.0 on the 128.

> better expansion etc.
Uh, no. There is an enormous array of devices widely available for the C64 that you simply won't find even today on the Ataris. Quick and easy hard drives are one example.

> When using the C64 it just felt like it was cobbled
> together by a commitee and then given to the programmer to figure out
> how to make it work.
This is by far the most ridiculous part of your entire statement. I've used both, and having been in the position of wanting to use my Atari and lacking a DOS disk, will take the C64 over it any day. (And don't even get me started on that stupid SIO connector.)

Please, if you're going to make statements like this, stick to quantifiable comparisons. We all like our machines of choice better than any other, and I'm sure we are all tempted to claim that they are the best.

I would be happy to stack the C64 next to an Atari, Apple, Spectrum, CoCo, whatever of similar spec and compare feature for feature.

Frankly, in these days where knowledge of these older platforms is dwindling, we should try to set aside our petty differences, our communities should be coming together to support one another, to explore other retro-platforms, to share our enjoyment of our favorite platforms, to recount our stories of the glorious BBS-era days, and to become one single unified retro-computing community which embraces all platforms.

Just my %10 cents.

Well, they do have harddrive solutions (I own three of them) but... somebody forgot to write a DOS to boot that would support something beyond 16MiB on a partition, not to mention that somebody forgot to write a DOS to boot that would allow normal usage of removable media like ZIP/LS/SyQuest etc. and of course I wouldn't call any of those solutions "quick and easy", especially when compared to the 64 based ones but of course: "ataris have better expansion possibilities" ...

> I've
> used both, and having been in the position of wanting to use my Atari
> and lacking a DOS disk

Uh, oh... ;-) Have you tried booting from cassette? ;-) ... Erm, that would require a DOS cassette... erm so you can't just easily check what's on the diskette and load a binary from it? Hm... I think that's the price for "professional" feel of the bootable DOS ;-)

>, will take the C64 over it any day. (And don't
> even get me started on that stupid SIO connector.)

That actually is possibly not THAT stupid. At least it was faster than the crippled IEC SERIAL bus on the 64... :-(

And the Amiga from Atari;-).

IIRC the guys that developed the Atari 8-bit designed the Amiga and the
guys that developed the C-64 developed the Atari ST.

No one forgot, in 1978 there was no zip/ls/syquest avaliable. Who cares
if it is better or worse on either platform? Both had strengths and
weakness'. The debate is over, neither won.

Dos is Disk Operating System. Not cassette. Personally I never got left
without a copy of Dos 2.5. Just bung it in the 1050 when you move it.

Yes, the Commodore 64 and the Atari ST were both created by the same fertile
minds. :-) When Jack introduced it to the world, the Commodore 64 was
the best 8-bit computer of its time.

Jack wanted to build a 16-bit computer better than the Amiga, but Irving
Gould would not let him, and booted him out of the CBM organization. So,
Jack had to settle for second best and build the Atari ST. ;-)

Yep, exactly.

After that first posting, I mentioned this web page I put up for it:

http://home.centurytel.net/hunmanik/tron/

It does play well I would claim, better than it probably looks!

I used to have an XT Clone that had MS-DOS in ROM. The Custom Phoenix BIOS could be set to boot from ROM, A: drive, then C: if no disk in A:, or C: without checking A: first. The DOS in ROM was version 3.31 IIRC.

Booting from the hard drive was reasonably fast, but a boot from ROM was much faster, even if doing so was very unprofessional. :-)

Drill a hole in the case, insert one stick of dynamite, and the Atari will expand quite nicely! ;-)

Which was a better computer than the Amiga games console;-).

The Amiga was initially setup by Atari, don't forget.

Man this is like 1990 all over again. Look we all know the Atari
machines where the best.

Mark

And the guys that wrote Amiga DOS 1.x wrote it on a Sinclair QL using
Metacomco's BCPL of all things :-) (Well at least the kernel)
Plus the Amiga can execute QDOS software natively using QDOS Classic -NOT
an emulator really- (and there's even a replacement Kickstart ROM that
turns it completely into a QL). As a matter of fact until the Q60 <url:
http://www.q40.de/> came along, a souped-up Amiga (with an 060) was the
fastest QL compatible that one could get his hands on.

Talk about being in bed with each other. One big Atari/Amiga/Sinclair family. Here's a question, was Amiga DOS under development during the period Atari were going to release the Amiga?

Mark

Moving from the ST to the Amiga was like a revelation. The ST was the weakest of all the Motorola 16 bit computers from that time.

Having GEM as the GUI and a DOS clone as the OS didn't help much either.
It was basically a PC with a 68000-class CPU.

No, better is a C64 with a Software-Sequencer (24) connected to a
synthesizer. Thatï¿½s digital. Forget abot thï¿½s clunkky, lousy and
irksome digital-soundchips. They are sounding alltogether terrible,
also SID.

Kind Regards,

Daniel Mandic

I forget.

Jay Miner initiated the Antic-descendent (however he would have name it). Money was low, so a Joystick Company called AMIGA adopted (cooperated) the financial things..... ATARI could buy AMIGA and the A1000 but Commodore paid obviously more for the mighty AMIGA. Etc Etc-.....

For everyone else the Amiga was best.

Listen to an Amiga MOD on an ST for a laugh, it's so pathetic.

Debating this in 2005 is weak.

Just enjoy the stuff you like, yeah?

Sounds very comparable on an STe...

Look Clockmeister, I believe we've talked before. I've actually owned
Amiga machines in the past. They are nice. I like them. I just prefer my
Mega STe and modded Falcon more. Each machine has its advantages and
disadvantages, agreed?

I tried this with my Falcon, but discovered hardware mods are
necessary. Forgive me if I am incorrect, but I think it is because
of the SCC chip instead of MFP like the ST. I have the SIO2PC cable
connected to my 1040STe with 800XLDJ and it works great (wasn't
willing to modify my Falcon).

You can use a standard SIO2PC cable with 800XLDJ (800XL DeeJay)
software. Works great!
```

I can't beat the ST specs but my 8-bit commodore next to me does a pretty
good job.

3.5 MHz
4096 colours pallete at 640x200
Double SID
Max of 8 Mbyte RAM

Show me a 8-bit ATARI system which comes close.....

When my parents got me a 400 and the entertainer kit for christmas '82,
it came with star raiders and pac-man. I couldn't tell ya what was on
the box, it is long gone.

I thought the second game varied according to what was hot at the time.
I know something was offered before the pac-man cart was available,
missile command sounds right.

So VHS was better than Beta? CD was better than DAT? Spice Girls are better than the Eagles? Numbers do not a computer make. By that analogy the Amiga was a POS compared to a 286.

Next.

Mark

It wasn't. Multitasking worked very well on the A500, the GEM/TOS hybrid was
neither here nor there.

How are your eyes after all that

No wonder since, as I stated previously, Amiga DOS was written on a *SINCLAIR* QL :-P

```

```

I get some visions of HAM mode though and my eyes hurt even more than with an ST.

Cheers,

Phoebus

Not at all since I never suggested that the Amiga was better because it sold
in numbers, only that it did and the Falcon didn't.

> Next.

Careful, your bias is showing.

7.14Mhz Vs 8Mhz? Tos worked well for me, I am not sure what you were
doing wrong. I found the Amiga piss farted around too much and took ages
to boot up too.
BTW my Atari's Multitask just fine as well.

So what is your point? Or was it just an observation?

So how is the 16bit DSP driven sound on the A1200 anyway?

>

Ain't that what I just wrote? I believed SIO to be actually,
unfortunately ;-) better than the C64's SERIAL bus... at least in terms
of speed.

Not then, no. In fact I don't think Atari ever made a hard drive for the
8-bit. Could be wrong tho.

It's like it is 1988 all over again, lol. I wasn't going to bother, but
it is fun. I was in a Atari/Commodore club, it used to go on all day.
The best thing was proving the other camp wrong;-).

It was like torture, I have 3 C-64's in the shed, never had time to play
with them though. Too many Atari's to choose from. Actually I have 2
Falcon030's (one with CT2), a TT030, A MegaSTE, a STE, 6 STFM's, a
520ST, 130XE, XEGS, 2 800XL's (one with 256k ram and Omnimon), a 600XL
(64k), a Lynx, a portfolio, a Jaguar, 2 2600's, 3 C-64's, A500, A2000,
CD32 (with SX1). Jez, I didn't realise I had collected so much, although
the wife does. No wonder I have no time;-)

Irrelevant when the CPU couldn't offload some of the workload to custom
chips.

Tos worked well for me, I am not sure what you were
> doing wrong. I found the Amiga piss farted around too much and took ages

The price you pay for a revolutionary OS. Multitasking was sweet...
And those silly partition limitations on the ST... what a joke.

> BTW my Atari's Multitask just fine as well.

Fine. Ever heard of productivity mode... or a flicker fixer even?

How is your knowledge of Magic, Mint, Multitos, Linux, Minix, SMS2, Geneva and NetBSD? And which one were you refering to? Magic, Mint, Multitos and Geneva are all relatively TOS/GEM compatible. How well do ALL WB 1 apps run under current AmigaOS?

All factory standard were they?

http://www.czuba-tech.com/DEESSE/english/overview.htm

Hows about them apples?

Can a stock A1200 play MP3's? My stock Falcon can:-)

Nonsense! The Commodore 128 was much better than ANY Atari 8-bit.
--
Best regards,

Sam Gillett

Change is inevitable,
except from vending machines!

What RAM limitations? The RAM limitations of the computers were more to do
with economical practicality at that time anyway.

You have just proved my point.

How well do
> ALL WB 1 apps run under current AmigaOS?
>

Irrelevant when both the OS and hardware has progressed well beyond the
original spec in the case of the Amiga. And before you start on about the
clones, the Hades was compatibility hell.

Any ECS machine with 2.1 could display productivity mode, and standard with
A500+.

I never needed one on my
> SM124.
>

Didn't need to. We didn't need to buy a (hideously expensive at the time)
second monitor either.

How much chip ram did the A1000 have? My STFM had 4 meg.

Which is?

Irrelevant when both the OS and hardware has progressed well beyond the
original spec in the case of the Atari.

The Clab Falcon MK2 was the ONLY Atari licenced clone. It was 100%
compatible with the Atari Falcon. All the other clones were developed to
run Gem apps, not to play Starglider. For that you keep an STFM around.
Much like you do on a modern Amiga, unless you emulate. On the Falcon we
had Backwards, which was a ST emulator for the Falcon.

What about A1000? That is the STFM era. 1985. 2.1 was 1992 was it not?

ALL 16bit and better Atari's could run with a VGA monitor. That is the
ST(M/F/FM/E), MegaST/E, TT030 and Falcon030.

Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

In actual use the ST isn't faster because the CPU has to do virtually
everything.

My STFM certainly did not. It had 1Mb and it was a shit to upgrade it beyond
that..
The A1000 could handle 9Mb.

Two very expensive monitors wasn't an option for most either, in fact that
idea was rediculous. At least the A1000 had the option, flickery as one may
have been.

> ALL 16bit and better Atari's could run with a VGA monitor. That is the

Too bad if you wanted to play games. I had a VGA monitor on my A500 also,
and it would have worked just as happily on my A1000.

>> I never needed one on my

Plug another monitor in just to play games.

It's always the classic argument that Commodore users try to use as ammo.

"Oh, my commodore was faster as it had custom chips!".

When will you guys admit that custom chips or not, it doesn't equal that the
computer was faster.

C64=custom chips
Speccy=none

Faster? Spectrum

Now you've moved onto the ST and Amiga. Still the same argument though. I
believe the ST was still faster than the Amiga, even with it's custom chips.

Hell the Sam Coupe was almost as fast, and that didn't have fancy custom chips
AND it was only an 8 bit machine!

But not as good as the Spectrum 128! :)

Actually, on an even more serious note, I'd like to play some C128 games.

Know where I can download some?

It couldn't do anything approaching what the C64 was capable of, so no
contest there.

> Now you've moved onto the ST and Amiga. Still the same argument though. I

The Atari wasn't anywhere near as capable as the Amiga, games had to be
dumbed down for the ST for instance.

You mean you can actually use the SIO2PC board on a ST/STE/Falcon as
long as
they will run 800XLDJ?????

With no modifications???

That would be great, let me know if I understood you correct.

Maybe that site had sometime to do with modifying the Falcon for the
SIO2PC.

But I don't remember seeing it.

It looked liked they were hard wiring a 800XL to the Falcon so that both
machines could
be used while connected together. If the SIO2PC doesn't work with the
Falcon, then maybe
this was a way to get them connected together.

BTW, When you connect an 8-bit such as a 800XL to a 1040STE with the
SIO2PC,
Where does the SIO2PC connect in the 800XL Chain if you have a couple of
disk drives
attached and maybe a Printer or someother SIO Device?

Can you have alot of stuff like the above connected to the 800XL and
still be able to use
the SIO2PC hardware on the 1040STE?

Does the SIO2PC hardware connection on the 8-bit side connect at the end
of the
daisy chain of SIO cables?

That flame between AMIGA and ST/TT is absolutely unnecessary. ST is a Audio Expert and AMIGA is a Video Expert. Both can do their strenghts w/o upgrading the Hardware.

Laughing about the flickermodes.... hey man, do you ï¿½know what you are talking about. Well, you could made your videoinlays with 640x200 in 4 ;-) colors. Iï¿½d take a standard A500 with 756x572 interlaced, full overscan... there you would need already a TT and the Overscan VME-Card (already a slot used 0:1), though you will only have 16 clors and too less lines. 0:2, 0:3.

Best Regards,

Daniel Mandic

Nothing sounds on MIDI better, than the mighty ATARI ST, TT or Falcon.
Forget it!

Tho only alternative, that is told to be as smooth as the ST-MIDI, is
the mighty Voeyetra-Set (ISA-BUS, Instrument and MIDI-Card) under DOS
and Windows 3.x.

Even that, the ATARI onboard-MIDI seems to work with all MIDI-capable
Devices ;-). Whereas the PC makes you more trouble in five weeks, as if
experienced with a ST/TT/Falcon in five years.

Best Regards,

Daniel Mandic

I'm sorry, I couldn't find prices for those cards. How much does it cost
to make an Amiga comparable, audio wise, to a stock Falcon? :-)

Faster tape loading - Up to 6Kbps :-)
Z80A processor clocked at 3.58Mhz
72K (48K RAM; 24K ROM) which is bankswitched between three internal 64K
memory banks called the HOME bank (16K ROM, 48K RAM), the EXROM bank (8K
ROM; this one is not completely decoded and can only hold 8K), and the
DOCK bank which is empty and is reserved for cartridges. The memory is
bankswitched in 8K chunks
DMA support and memory bankswitching.

Superior Basic (and with GW & Se BASIC... PERFECT BASIC)

Cheers,

Phoebus

More than that! 512 x 192 (T/S 2068 - Since we're comparing American
computers ;-)

>> Hardware sprites?

nope

>> Smooth scrolling?

yep and then some with buffered screens (256 x 192) ((T/S2068)

>> More than 2 colours in one 8x8 pixels grid? -

Yep 256 x 192, 32x192 attributes ;-) (T/S2068)

>> 3 voices of highly programmable sound? -

Nope, more: 3 +1 AY-3-8912 (T/S2068, 128K, +2 etc..)

>>
>> What could the Spectrum do that the C64 couldn't?
>>

* Faster tape loading - Up to 6Kbps :-)
* DMA support and memory bankswitching (T/S 2068)
* Superior Basic (and with GW & Se BASIC... PERFECT BASIC)
* Slow Scan TV! (Yes)
* Drive your Commodore-owning neighbour mad (always a plus)
* Appeal to girls ;-) (Black is always in fashion)

Cheers,

Phoebus

You guys need to get over this.

Take a leaf out of Nintendo's book - they've actually said "Our latest
machine won't be at all as powerful as its competition". They're
relying on good software and innovation rather than specs. Okay, they
might fall flat on that one, but if they can say that about their own
machine that will decide the future of their company, perhaps you

should let go and stop having these hateful arguments about computers
that are 20+ years old.

There's an important group you've left out of this crosspost.

I wonder if this will summon Scoopex?

My question was not what hardware has the C64 got that the Speccy hasn't got.

My question was what can the C64 do that the Speccy can't?

And apart from the resolution, which I do concede the C64 has got a higher
"mode", what else? The Speccy can do the rest.

I am sad to admit it, but there is one thing that the C64 can do and the Spectrum (as of now at least) cannot...

see here: <url: http://tfe.c64.org/> and this: <http://dunkels.com/adam/tfe/>

Someone make something similar for the T/S2068, the Speccy or the ZX81 and I will stop whining immediately :-)

Nope. I could maybe make one, I have a little program that
reads sector 1 for First Sector Map and First Bit Map, then you can
look at the directory entries, which are 23 bytes, with info about the file
and the filename itself. You just want one that reads filename and size, or
also time/date, in use, deleted?

I'd be interested in such a utility too! (Pre-made or write my own)

Anyone have a link for the various SpartaDOS disk layouts? I'm personally interested in 1.1H and 3.2xx (the one realeased to PD is what version?), not so much for SpartaDOS X. Reading Bewesoft DOS disks would be good too (if there is any difference vs SpartaDOS formats).

Additionally, I would like to be able to copy files off SpartaDOS disks using MyDOS, not just view directories.

Taking this a little further, are there any Atari utilties that are good at identifying DOS disks, the format and the version number?

Hi Russ, Steve-

Russ, if you already have something, I'd appreciate a copy. BASIC?
Perhaps we could all three work on this? I do have the SpartaDos
Construction Set, so I presume that it lays out the details of the disk
architecture. The idea of being able to directly copy files from a SD
disk to a MyDos disk is certainly a good one. Sort of a "PolyCopy --
SD." Sounds interesting, fun, and doable.

Steve, I'm not aware of any utility that could differentiate different
Dos disks. I think that would be pretty difficult, unless the actual
Dos files are on the disk, and of course, it would be simple to
identify Sparta (and probably Bewesoft).

2 in the room I am typing this in. I have never seen an Amiga sound
card, seen plenty Falcon's tho;-)

One has a CT2, 80 meg of ram, 10 gig hard drive, zip drive, Yamaha cdrw,
Panasonic CD and the other is fitted with a 6 gig hdd and 14 meg ram.
Hows the chip ram on a standard A1200?
My CD32 with SX1 could not hope to compete with the Falcon.

Mark

I have upgraded a few ST's. The STE has simm slots built in. The STFM's
could use a marpet type upgrade that takes 15 minutes to fit, if you
know what you are doing. I have even done a few chip upgrades as well as
hot wiring in Simms directly. NONE of them were difficult.

> The A1000 could handle 9Mb.

Chip Ram?

Yup and you could run the Monulator on the ST or Sebra. But no-one used
them for serious use.

Or use a TV. The STFM had a built in modulator, why did the Amiga omit

it when the majority were used for games playing? Soooo many A500's I saw with the A520 fitted, what a mess, not to mention the external brick.

Funny that is what Obi Wan Kenobi said.

You are in Perth aren't you? If you are ever in Melbourne, Pop in and I will let you have a listen to a couple of S3M's on a Falcon, through the Altec Lansing speakers I use in here. Heaven.

Ditto here. I've got a CT60 powered Falcon (95mhz '060), with 256 megs of
SDRAM, 14 megs ST RAM, 80 gig Maxtor IDE HD, PlexWriter 12/4/32 SCSI CDRW,
450 watt ATX P/S, wrapped up in a Wizztronics Falcon rack case, running

the MINT OS/Thing desktop.

I've owned (in order), an A1000 (I still like the layout of this machine a lot, especially the keyboard well), an A2000, and an A1200. None of these Amigas could match my stock Falcon, let alone in its current state.

Just for the record, I really do like Amigas... If I could find a good deal on an A1000 in good shape, I'd probably pick it up for old times sake. I just think my Atari comps are a notch above them.

I have a lot of respect for both computer lines and their (important) place in computing history.

C'mon Clockie, can't we just acknowledge that both have strengths and weaknessess and let be? :-)

Yeah, the Falcon is a nice seat. ;-)

Plaese stop .... rotfl.. this all Falcon Amiga Stuff...

The Falcon does not have the slightest chance. Well, it does have itï¿½s
Strenghts, DSP, MIDI, IDE (erm..)etc... but letï¿½s say real - AMIGA is
the right HC. Or, it was at that time. Falcon was a last attempt to
save something which donï¿½t want to be saved. Instead of making a cheap,

and better than the ST, new Design (again with MIDI), they tried the onboard-sound Sector (ruled by Paula, SID, Archimedes, ULA), already being collected by PC and Soundcards.

Nice Machine.... but vs. the AMIGA. hmmmm. I had A4000/030/040, A1200, A500/+ (2MBChip, Standard and not soldering), A2000, A2000/040/060. 1024x768 True Color Z2, 68060/60>MHz (like a p100-200), Fast-Scsi II ..... at this time Atari started with the first 040 clones... ha.. I have pulled the 060 in the A2000 and it worked. With every Z and ISA Card, indeed.

Five Years after AMIGA died, the IBM-PC overtake. Yes, Yes ... at least five years.

Well, today I am as fast. But at least the noise level, got nearly off. PC.

Best Regards,

Daniel Mandic

I had a A1000 for a while, swapped it for a A500 then got a A2000. Got
given a CD32 for fixing a few Amiga's for a friend. I love it. Have a
350 meg HDD and 8 meg in my SX1 ;-) I could watch demos on the Amiga and
Atari all day (before I had kids - better get the little on up I suppose).
>
> I have a lot of respect for both computer lines and their (important)

Damn straight. Amiga and Atari were out of the same stable. Whether
anyone wants to admit it or not. If it wasn't for Atari the Amiga would
not have seen the light of day and if it wasn't for Commodore the ST
would not have seen it either.

Its an awesome machine. Sometimes I just sit in amazement when I turn it
on and watch it bootup. Even with MINT, it boots up blazingly fast.
Honestly, I can't follow the onscreen text!

I hear ya. Love those Euro-style demos. Like you, I'm mesmerized by them.
I could sit and watch Sonoluminesence, Hydroxyd, etc, etc, etc,...all day
long.

You can find a good selection of Public Domain and Shareware/Freeware games
here:

http://cmdrkey.com/cbm/genie/C128GamesListing.html

As with any collection of this type, some games are good and some are not.
Try several until you find some that you like.
--
Best regards,

Sam Gillett

Change is inevitable,
except from vending machines!

Oh god no, I'd rather play commercial stuff.

I've never been interested in free domain stuff. Even on the Speccy, I've
preferred to play the old 80's games you could buy off the shelf.

I'm funny like that.

Maybe so, but so then is Fatboy Slim, who uses ST's to make his dance tracks
that have sold millions around the world.

|
| More than that! 512 x 192 (T/S 2068 - Since we're comparing American
| computers ;-)

We were talking about the Spectrum, not the Timex. The Timex wasn't
very compatible with the Spectrum, and there wasn't a lot of software
produced for it, was it?

|>> Smooth scrolling?
|
| yep and then some with buffered screens (256 x 192) ((T/S2068)

How about the Spectrum?

|>> More than 2 colours in one 8x8 pixels grid? -
|
| Yep 256 x 192, 32x192 attributes ;-) (T/S2068)

How about the Spectrum?

|>> 3 voices of highly programmable sound? -
|
| Nope, more: 3 +1 AY-3-8912 (T/S2068, 128K, +2 etc..)

How about the Spectrum?

|>> What could the Spectrum do that the C64 couldn't?
|
| * Faster tape loading - Up to 6Kbps :-)

The stock tape routines of the C64 sucked, yes. But most games
used some sort of custom turbo tape routines. Most applications
were released on floppy disk.

| * DMA support and memory bankswitching (T/S 2068)

How about the Spectrum?

| * Superior Basic (and with GW & Se BASIC... PERFECT BASIC)

Lots of basic extensions and replacements for the C64 as well, though
just about anything worth having were made in machine code anyway, for
both the Spectrum and the C64.

| * Slow Scan TV! (Yes)

Please elaborate.

| * Drive your Commodore-owning neighbour mad (always a plus)

Spectrum users didn't need any such driving, or if they did,
it was a very short ride. :-)

| * Appeal to girls ;-) (Black is always in fashion)

A-ha, so _that_ is why all Spectrum users are women...

| My question was not what hardware has the C64 got that the Speccy hasn't got.
|
| My question was what can the C64 do that the Speccy can't?

What can be done with software is very much dependent on the hardware on which
it is run and not much else, so I fail to see the distinction.

Sure, I never have disagreed with that but the claim that ST's are better
then any Amiga is nonsense.

Euro style demos on Amiga = heaven.

Ok Atari too but they weren't as impressive you have to admit.

Nonsense - the SID chip is an analogue/digital (mixed) synthesizer
with proper envelopes, lots of waveforms and a filter. It sound is
very complex - even PCs can't replicate it perfectly, let alone a

Spectrum on an AY.

You're timbre deaf!

Wrong. There are options for Atari's as well.

> well, I'll just stick with my
>> Falcon. :-)
>
> Good for you, it's a nice machine in it's standard configuration, no

Yes, very nice in its standard configuration. Of course, mine is way
beyond "stock" now:

95mhz '060 CPU
256 megs SDRAM
14 megs ST RAM
80 gig HD
Plextor 12/4/32 CDRW
Wizztronics Rack case

The question is Clockie, do you prefer your nowadays PC over your Amigas?
There is no doubt that my AMD powered Linux box with a 19" monitor, 120
gid HD, 512 megs RAM, etc, etc out-specs my Falcon (and your Amiga), but
which do we **enjoy* using more? :-)

> then any Amiga is nonsense.

I still disagree with you here. Why? Because use of a computer, is very individualistic. "Better" doesn't necessarily have to mean hard specs that are better or less from one computer model to the next. Give you an example, setup my main AMD computer with Windows. XP, 98SE, it don't matter. Then set it up with Mandriva Linux. Which is more enjoyable? For me, beyond any hope of arguement, its Linux. I think Windows (any version) and MS suck vacuum hard. Its the exact same hardware, but the machine is absolutley *totally* different under these 2 OSs. One for me is enjoyable, the other is a real PITA.

Same with the Amiga and Atari. Sure, on some individual models, the Amiga has some better hard specs. Sure, on some individual models, the Atari line has some better hard specs. There is nothing wrong with Intuition and Workbench, I just feel infinitely more comfortable with TOS. So, as I said, its very individualistic. Thats why I feel when someone says, computer X is better than computer Y, and someone else says thats nonsense, I can't help but feel that the issue is being overly simplified. I could accept it if you said, "the Amiga is better for me". As I'm saying, Atari is better for me... :-)

Everyones mileage may vary, of course.

```
Yes and the reason for the link was that it can run a webserver (not the
TFE hardware but the actual software) and connect to the net. They can, we
can't (darn).
```

We're probably closer to having web-server hardware for the Speccy than
we are to having web-server software, though.

the distinction is that with a stock C64 and a stock Spectrum, there's really
nothing (bar the resolution) that the C64 can do that the speccy can't in games
or apps.

Moby too at one time I believe. None of that proves a thing though, the
amount of TV networks, artists and studios etc that used Amigas is just as
impressive.
They were the glory days for the niche systems...

The Amiga was simply a more capable computer. Sure, the ST was better at
one thing out of the box, but that was it.
Read the hardware specs, from a technical point of view the Amiga is simply
much more impressive.

Give you an
> example, setup my main AMD computer with Windows. XP, 98SE, it don't
> matter. Then set it up with Mandriva Linux. Which is more enjoyable? For

OS choice, yeah OK I've tried Linux and Windows of various ilks and now use
XP.

> Same with the Amiga and Atari. Sure, on some individual models, the Amiga

Sure, it's subjective and that is a fair enough but for me using TOS is like going back in time to the dark ages.
Remember, I had both an ST and an Amiga at the same time (ST first) and I simply cannot see the benefit of owning an ST unless you are into MIDI.
The ST simply lacked that jaw dropping WOW factor the Amiga had.

To each their own.

Absolutely. Games like BF2 rock, the application choices are wide and varied
plus XP is good. I hardly use alternatives at all anymore.

> There is no doubt that my AMD powered Linux box with a 19" monitor, 120
> gid HD, 512 megs RAM, etc, etc out-specs my Falcon (and your Amiga), but

To be honest, I enjoy my PC. I still wish the multitasking was as fast and
smooth and efficient on my PC as it was on my Amiga, but of all the OS's
I've tried none come close.
Ah well, I can live with it.

I should have realized this and probably would have if I took the time
to think. Maybe not. Sometimes I'm just slow.

- Steve Sheppard

Again, you're missing the point. I said what can the C64 do that the Spectrum
```

can't, regardless of hardware.

Now Sprites... Yup, speccy can do that.

Next?

I'm pretty certain they didn't, although David Whittaker did use their samples
to great effect to recreate Megablast for the game.

Bomb the Bass were big Amiga fans and did in fact use them. So do Men at Work, and numerous DJ's and electronic artists around the world. Listen to JJJ and Paula's distinct ring pops up time and time again.
EA still uses Amiga 1200's for creating voice synthesis and sound effects in games too.

Been there and done that. I'm over it, Linux is overrated at best and a
nightmare at worst.
I just want my OS to work, run what I want to run and I don't want to spend
time rooting around just to get something to work.

Oh, I never needed one on my A500 and 1024x800 A2024 monitor neither.
And how well BTW your ST worked in a video editing environment _without_
the interlace modes?

Again (changing the nouns to verbs):

- display multiple, 1:1 frame synchronised, perfectly smooth moving sprites
- present smooth 1:1 frame synchronised scrolling of the text and gfx
- render more than two colours in in one 8x8 pixel chunk
- play music rather than beeps ;-)

etc., etc.

| What about the framerate?

Show me an example of a Spectrum game (or demo) with smooth scrolling (vertical
or horizontal) full screen graphics, and 30 or more sprites moving individually
on top, all running at 50 fps.

I did fit a overscan circuit which consisted of 2 ic's and a driver. It
worked well. I never got into video editing. I did do some on a friends
Falcon, it was able to do 16bit. And 1024x768 on a VGA monitor.

Mark.

Larry. I'd be glad to give you my little BASIC program I call
splook.bas. It is little more than a raw sector reader, and quite a ways
from being a directory lister, and not at all a file copier. I'll send it.
Sparta/FTe has the location of the first directory sector map in the
boot sector 1, 23 byte records for each file. Then you go to the
sector map of the file. The first two bytes the next sector map, zero
if last map, second two bytes previous sector map sector. Oh,
well, I'll send it. It uses abbreviation of First Sector Map, FSM.

The closest I can think of off the top of my head is part 3 of NMI 3:
http://www.zxdemo.org/item.php?id=3042
Unfortunately that only scrolls two thirds of the screen, so you'll have
to trust me that it *could* have been done full-screen, except then we'd
lose the nice logos.

Whoops! This thread did get badly sidetracked didn't it?

As a doorstop, the Spectrum wins hands down... or rubber keyboard down... as
the case may be.

How did the X-Box get into this? It isn't even an 8-bitter.

Here is at least a partial list, copied from another thread in comp.sys.cbm

A Mind Forever Voyaging
Bureaucracy
Beyond Zork
Hitchhikers Guide to the Galaxy (Solid Gold Re-Release)
Kikstart 128
Last V8 128
Maidstone Quest
Nord & Bert Couldn't Make Heads or Tails
Rocky Horror Show
Sherlock: The Riddle of the Crown Jewels
Space Pirates 128
Starship Battles 128
Thai Boxing 128
Trinity
Ultima V
Zork I (Solid Gold Re-Release)

Zork the Undiscovered Underground

I don't deal in warez... I'm funny like that. So, I don't have any download URL's, but a little searching should turn up cracked copies of some of the above games.

In hardware? Without using Z80 clock cycles?

The VIC chip in the C64 can move sprites around on the screen _without_ any
help from the 6510. The main processor can be busy doing something else
while sprites move.

It occurred to me that silverdr wrote in comp.sys.cbm:
> Da Smog wrote:
>
>>>
>>> What could the Spectrum do that the C64 couldn't?

>> 72K (48K RAM; 24K ROM) which is bankswitched between three internal 64K
>> memory banks called the HOME bank (16K ROM, 48K RAM), the EXROM bank
>> (8K ROM; this one is not completely decoded and can only hold 8K), and
>> the DOCK bank which is empty and is reserved for cartridges. The memory
>> is bankswitched in 8K chunks
>
> No sense...

Not to mention the fact that it's untrue; A stock C64 holds 64K RAM, 4K character ROM, 8K Basic, 8K Kernal ROM - cartridges have another 8K to their disposal, and some I/O addresses too. So, that sums up to 84K.

Hey, I might get nitpicky, and include the Colour RAM: 1024 memory locations, of which only the lower 4 bits are actually used, but then I'd have to compensate for the fact that $0000 and $0001 are actually I/O, and that the underlying RAM isn't particulary easy to access. Either way:

YOU LOSE.

Bank switching is much more elegant, too. The lower 32 KB of memory ($0000-$7fff) always holds RAM - at least from the CPU's point of view. The next 8K ($8000-$9fff) usually holds RAM, except when a ROM cartridge is inserted. $a000-$bfff holds either the BASIC interpreter, or RAM (Selectable with an internal I/O port). $c000-$cfff is always RAM (and not in use by BASIC, so it's a convenient location to store your machine language gimmicks). $d000-$dfff holds either RAM, the character generator ROM, or the I/O area (The 6502 doesn't suffer from the wicked concept of a seperate I/O memory space). Out of this I/O range, 2 banks of 256 bytes each are mapped out and available on the expansion port for use by external devices. The last 8K of memory ($e000 - $ffff) is either RAM or (kernal) ROM, once again selectable with an I/O port.

The fact that there's "RAM under ROM" is very convenient, too; when ROM has been selected for a particular area, all writes will go to the RAM. This means that you can easily copy the ROM to the RAM, make some alterations, and switch over. This was a commonly used technique to make OS changes.

So once again: You lose.

>> DMA support and memory bankswitching.

The C64 had bank switching (See above), and it did feature DMA support, too.
This DMA support was even used to add additional CPU's to the system. There
was a CP/M cartridge available which included a (severely underclocked) Z80
which could take over the bus. the Commodore memory expansion kits did their
transfer over DMA.

It has a 8bit heritage;-)

Gah! Again I state! I not comparing hardware. I'm comparing ability of each
machine - WHAT THEY CAN DO - regardless of hardware.

The C64 has sprites... so does the spectrum. Hardware or not.

Do you understand now?

That is not the most impressive C64 demo indeed. Demo's like Deus Ex
Machina do a much better job of showing the true capabilities of the
C64. I have yet to see a ZX Spectrum demo or game that is graphics- and
sound-wise impressive compared to C64 standards.

That was just an example (and an old one at that) of what you can do with
hardware sprites.

After the insightful posts from Peter, he only confirms my thoughts that you are
indeed just trolling for arguments, and haven't actually shown any evidence to
back up any claims that the C64 can do more than the spectrum.

You want me to argue with you when all you want to do is dumb it down to
which computers produces the nicest looking letters on screen.

It is all about the hardware, like I said produce a demo that matches
anything like what a stock C64 can do easily and we can discuss further.

I'm not a coder, but I have eyes.

Well use them then! Repeatedly I've asked for al ist of things a C64 can do that a Speccy can't, and all you can do is refer to hardware. I'm not talking hardware. You've only come up with one thing so far - resolution - but nothing else.

You've lost the argument on attributes, sprites, sound and just about everything else, so what else have you got?

4425. Finding a debugger

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-04 19:34:04 UTC
From: "tom@iccy.org" <tom@iccy.org>
Message-ID: <1133724844.720015.47930@g49g2000cwa.googlegroups.com>
Source record: 9081

I've recently gotten back into 8-bit programming, and I've decided to start learning 6502 assembly. atariarchives.org has several books online which I've been reading through, and I'm starting to get a good basic understanding of how the 6502 works (I can add 2 numbers, as long as the result is less than 255 :P). I've been trying out examples using Mac/65. I've found both a cartridge image and a disk image for Mac/65. The cart is version 1.01, and includes the DDT debugger. The disk image filename is M65V42, and it's the one FTe released as shareware for use with XFormer. This disk doesn't seem to have a debugger (or I don't know how to access it). I've been reading through Atari Roots on atariarchives.org as a tutorial. This book is mainly written for an older Mac/65 disk version, which included the Bug/65 debugger (which I do not have). The book has a nice chapter on using this debugger. I thought about contacting Mike at FTe, but I gather from other posts that he is MIA.

I'm looking for 3 things. First, does anybody have a text file or a manual which describes the operation of DDT? If I just had a list of the commands, I could use DDT. Second, does anybody know where I might find a copy of Bug/65? I got my two Mac/65 images from the CTH archive, but I haven't come across any debuggers at all in this archive. Of course, the files have no descriptions. Third, does anybody have any tips for other directions I might go? I haven't really tried any other assemblers.

Thanks guys!

-Tom Rosso

You can't compete on the level the C64 is playing at. You can't play SID's like their supposed to sound, you don't ahev hardware sprites that blitz anything the Spectrum can come up with, you don't have demos that leave anything you can come up with in the dust. I'm glad you are happy with your boring, colourless uninspiring little calculator, but it doesn't cut the mustard in my book.

As much as you wish it to be different, it isn't.

And a good job too - you're definitely a lot more argumentative than anyone else in this discussion. I think that you should spend some time actually watching some demos before you pass judgement - but you won't, because it's obvious from your "tone" that you find the Speccy offensive (else you wouldn't have wasted so much effort defending your C64) and as such you'll just sit there secure in your own opinion without having any shred of evidence to prove your point - you've played with a C64 and seen it's demos, and you've looked at some screens from a speccy. Hardly a comparison.

You come across as a whining bigot most of the time. The only thing that prevents you from becoming classified as a troll is that you respond to people's replies. But that's the only thing.

And it's rather amusing watching Starglider winding you up - you've bitten every time.

Typical reaction from you...

"Ooh! Ooh! Our hardware sprites! Ooh! Ooh! The SID chip!".

Still having to rely on hardware to try to prove your point.

I'm still waiting for this almighty list to show what the C64 can do that the
speccy can't.

I'll tell you why you're not answering it...

...because you can't actually think of one thing it can do more than the
Spectrum.

Sad, sad little man.

A computer can not do anything that exceeds the capability of the hardware.
In other words, WHAT THEY CAN DO depends to a great extent on the hardware
available for use by the CPU, and hardware available to give the CPU a
helping had with some tasks.

> The C64 has sprites... so does the spectrum. Hardware or not.

Using 1980's terminology the Spectrum does not have sprites. It can be
programmed to use MOBs (Movable Object Blocks). MOBs were also used in many
other 80's machines, for example, IBM XT Clones with CGA.

On the screen, a MOB looks a lot like a sprite, and may even move somewhat
like a sprite. The trouble is, that even with the block memory move command
of the Z-80, moving half a dozen MOBs takes huge slices of CPU cycles.

As the 80's turned into the 90's, video cards for PC Clones were improved.
The ability to move object blocks without eating huge amounts of CPU clock
cycles was implemented in the better video cards. And then came 3-D video
cards. PC Clones had always been good at word processing, spreadsheets, and
data bases. Now they were good game machines also!

A quick ebay search finds 3.

Whilst a search fo Amiga soundcard or Amiga sound card draws nil.

About 10 Amiga 1200's on ebay, none with sound cards.

Mark

Define what a sprite is then. because by your very own definition, a sprite is
also just a MOB.

Movable objects that are not painted on the bitmap but over/underlayed on
screen by the video chip.
They're called also missiles on Atari. Normally a MOB is referenced as
Software sprites, ie on the c16/+4

This one of the most comprehensive article about the VIC Chip:
http://www.minet.uni-jena.de/~andreasg/c64/vic_artikel/vic_article_3.8.htm

And for what it counts, these are the definitions in wikipedia (scroll down
to "Hardware sprites")
http://en.wikipedia.org/wiki/Sprite_(computer_science)

You're an idiot. You simply keep moving the goalposts so that in your mind you can never *lose* the arguement.

FYI it's an arguement you can never *win*. The Speccy simply is more limited then the C64, and that is all there is to it.

The problem is that they still do not understand the question.
To elaborate, a sprite is a sprite, hardware or software, to the effect
that the user sees the same thing.

If you quantify then you could ask:

Q. Can the Spectrum draw as many sprites as a C64 can at the same speed?
A. The answer is yes regardless of how it does it.

Q. Can the Spectrum display colours at a 8x1 attributes like the C64?
A. Yes it can (same as above)

Q. Can the standard Spectrum play digitised sound or 3 +1 sound?
A. Yes it can (via Software yes...) but it does nonetheless

Q. Can it peform number crunching faster than the C64?
A. Yes it can.

See if you ask qualitative answers, these are subjective and they can
never be answered in an impartial way.
Quantitative answers though can be answered... even if one doesn't like

the results.

Now you could say that you don't like the results of the demos, or how it sounds or a number of other things. That's fine... I personally do not like fish ;-) You cannot make me eat it even if it's the best thing in the world. Same with your machine of choice. If you say that you don't like a machine just... *because* :-) That's an acceptable statement even if the other party doesn't agree with it.

The facts though support Starglider. Anything that the C64 can do (except run a webserver maybe) a Spectrum can do too, regardless of how that is achieved.

What has been going on, is that one sayss the equivalent of the following statement: "It is day outside". And the answer instead of being acknoledgement of the fact, becomes: "Well I do not actually like the particular blue of the sky, ergo it is night)

My 2 cents

Cheers,

Phoebus

There is plenty of them out there.

I've still got mine though it's been boxed up for a while now since we are
renovating.

There are plenty of A1200's out there, so ofcourse more will be on sale then
Falcon's which are pretty rare by comparison.

If I came across a Falcon I would snap it up.

2. I have a bad OCR scan (yeah, I'm too lazy to clean it up) of the DDT
manual I'll send you.
3. If you want to cross-assemble, you might go with atasm or ca65 (or
others) to compile at PC speed. I also recommend dis6502
(www.sf.net/projects/dis6502) for cross-disassembling.

I would be quite happy to trade my A2000 and A500 for an A600. Only
downside is you can't play F1GP on a A600 IIRC. Doesn't matter though,
it was faster on an STFM.

Much faster on an A1200 or the A2000 I had at the time. It was a good game.
I enjoyed playing Wings, and Dune II as well, brilliant with the Supraturbo
28 accelerator I had, 28Mhz 68000 overclocked to 40Mhz A2000 :-)

I personally don't see the point of owning an A600 when A1200's are much
better, more common and it has plethora of expansion options available for
it.

.

Hmm you she see it on a 50Mhz Atari Falcon (CT2), runs like a cut cat.
Vroom too.

Items Missing:
* Horse Gender
* Source of Internal Injuries
Hypothesis:
(He) was a male horse. Didn't particularly care fore being buggered,
and thus kicked the innards out of the camera guy.

Couple of life lessons for the kiddies:
* Don't have sex with animals.
* Don't have sex with animals of your gender
* Don't offer to film anyone having sex with an animal
* If you must film someone having sex with an animal,
make sure that the money's good, you're paid in advance,
and fer'goshsakes use the TELEPHOTO LENS.

Unless you like jails,fines,courtrooms, or don't like your innards.

...and if you really must...

* Always ensure the animal is smaller than yourself
* Check animal for powerful hooves, teeth, claws, venom etc before getting
your apparatus out

Finally, make sure the animal is large enough that it won't split on the
first thrust.

It's at this point that sheep look promising...

|
| If you quantify then you could ask:

I agree with your line of questioning. However:

| Q. Can the Spectrum draw as many sprites as a C64 can at the same speed?
| A. The answer is yes regardless of how it does it.

This conclusion I'd like you to explain. The C64 can display more than 100
sprites moving on top of other bitmapped graphics, without the CPU having
to do anything else than setting the x/y position and data pointers. On the
Spectrum, the CPU will have to a) either redraw the complete background each
frame, or create a copy of the background image under the area where each
"sprite" is to be drawn, and b) draw the sprites above or below the background
image and perform the appropriate masking.

Somehow I don't think the CPU of the Spectrum will be able to do all this
with a scrolling background and lots and lots of sprites. I will ofcourse be
convinced if you send me a link to a game or demo that does all this, and
a link to an emulator I can use to see it in action.

Here's another question for you:

Q. Can the Spectrum use sprite colours that are separate from the colours
used in the background image, without any form of colour bleeding?

You've gotta be shitting me? How can a crappy machine with only a 68020
keep up with a 68030 and a 56001? Its like comparing a Holden Camira to
GTR Godzilla Skyline. As far as the STE goes I have seen several demo's
that easily rival the A500, both machines are very close in terms of raw
horsepower, but comparing a Falcon030 to an A1200? Especially after
carrying on about custom chips. The DSP in the Falcon alone is good for
around 16mips. And being that it is fully programmable, it can be used
for just about anything (giving a total of 20 mips for the Falcon
WITHOUT a 68882). Bizarre. Although, if you concede that the A1200 DOES
keep up with a Falcon (chuckle;-), then you have to concede that a STFM
CAN keep up with a A500, or a Speccy CAN keep up with a C64. Get a hold

of the Froggies over the fence demo, or the Sam Fox demo.......
thousands to choose from.

http://www.dhs.nu/
http://www.atari.st/ (click on Amiga;-)

Might sit down and play a few demos on the MegaSTE, thanks;-).

Mark

Too fast I imagine, there is a hack to slow it down on systems that are too
fast for the game, for Amiga anyway.

MW> scrolls two thirds of the screen, so you'll have to trust me that
MW> it *could* have been done full-screen, except then we'd lose the
MW> nice logos.

That just repeats the same 16x16 pattern across the screen, which is
hardly what Lars meanth. How about scrolling a full screen of actual,
meningful graphics, with some sprites on top? The end part of Demode
is a pretty good example, with an IFLI image (6 colours per 8x1 cell)
and 16 sprites on top:

http://noname.c64.org/csdb/release/?id=15101

Of course, demos are all about cheating. How about an 8-way scrolling,
full screen, 50 fps game? Turrican II demonstrates it nicely:

http://www.lemon64.com/games/details.php?ID=2730

MB> You've gotta be shitting me? How can a crappy machine with only a
MB> 68020 keep up with a 68030 and a 56001?

Well, both machines have several architectural problems. The A1200 has
a 14 MHz 68020 on a 32-bit bus, but is bottlenecked in chip ram by the
custom chips (in fast ram it runs at full speed). The Falcon has a 16
MHz 68030 on a 16-bit bus, and as the 020 and 030 are about equal,
IIRC the A1200 is even a little bit faster. The 56001 is nice though,
and a general purpose coprocessor, as opposed to the Amiga's specia-
lized blitter and copper. Either way, the machines are definitely in
the same ballpark.

MB> Get a hold of the Froggies over the fence demo, or the Sam Fox
MB> demo....... thousands to choose from.

MB> http://www.dhs.nu/
MB> http://www.atari.st/ (click on Amiga;-)

New demos are always fun. What are the top 3 unaccelerated Falcon
demos? 060 stuff doesn't interest me, it just looks like crappy PC
demos...

Hmm, not arguing here, honest curiosity, but I thought the Falcon was 32
bit internally? Also, it does have a blitter chip as well.

I've asked this question before: name one demo that truly shows off the
capabilities of the Spectrum. Give it your best shot: which Spectrum
demo turns the faces of the CSC crowd green with envy?

Agreed, they aren't inspiring at all. Still amazed by what the C64 can be
made to do some 20 odd years after it's introduction.

RJH> Hmm, not arguing here, honest curiosity, but I thought the Falcon
RJH> was 32 bit internally?

It sits on a 16-bit memory bus. It's still a 68030 CPU with full
32-bit registers and ALU, but the memory speed is halved.

RJH> Also, it does have a blitter chip as well.

Yes, but apparently it's quite slow. The first google hit for "Falcon
blitter" gives you:

"Unfortunately, the Falcon Blitter is rather useless since the 68030
is, when doing a simple 1:1 copy, about a factor of 4 to 5 faster
than the Blitter in the Falcon is, even though the Falcon Blitter is
running at 16 MHz. On the Falcon, the Blitter can become useful if
you plan to heavily use Halftone-pattern, bitwise-shifts and logical
operations. Otherwise, use the CPU instead."

Who needs demos? there are planty of games that can do that. Starglider, Carrier
Command, Starstrike are just a couple of examples.

The Spectrum has hardware support for flashing things on the screen. I guess the "usefulness" of that feature was enough justification to limit the choice of the colors in an attribute cell to either two high brightness colors or two normal brightness colors.

A6000 is smaller, and I already have a CD32.

> is also just a MOB.

No, by _your_ definition, not _mine_.

An MOB must be moved in memory in order for it to move on the screen, and the background beneath the MOB must be redrawn to avoid creating a hole in the background where the MOB was before being moved.

On a machine like the Spectrum, moving an MOB the same size as a C64 sprite smoothly from one side of the screen to the other side, all the while redrawing portions of the background as necessary, requires huge amounts of CPU cycles.

A sprite can be moved on the screen without moving it in memory, and is nondestructive to the background that it moves over.

A sprite on the C64 can move all over the screen without ever being moved in memory, and without affecting the bitmapped background beneath the sprite. The magic is done by the VIC chip (Video Interface Controller), and only a few clock cycles from the CPU are needed to instruct the VIC chip as to what it should do with the sprite.

The Spectrum just can't compete with the Commodore 64 because it isn't even in the same league!

> Also, it does have a blitter chip as well.
>

Yup, my CT2 is actually 32 bit tho, one of the improvements by Rudolph Czuba. Interestingly enough, not alot of progs use the blitter, because the 68030 gets no real benefit. Also it cannot be overclocked, but because it is a part of the Videl chip, it cannot be removed. I run a little app on boot up that switches it off completely. Otherwise the screen garbles if it is enabled. Also, using NVDI or FVDI is a software blitter than is actually FASTER in operation than the hardware one.

How many mips is the A1200? 1.6? Not even close to the Falcon on its worst day, crippled or otherwise. A 68030+65001@16Mhz combo is always going to out do a 68020@14Mhz, especially after dropping a 68882 into the equation;-). Does the A1200 have a copro?

Again if you concede that the A1200 can be made to appear faster than a Falcon then the same can be said for the STFM v A500. And believe me I have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth scrolling even on a stock STFM, every bit as good as an A500. One demo I saw was having a crack at how badly Shadow of the Beast was coded (ported) to the ST. It had all the elements of what Psygnosis should

have done. The bitmap brothers could do it.

Never bothered with PC demo's, plenty on the Falcon/TT/ST tho. The 800XL
is the same, and even the STFM is having MORE boundaries broken as time
```

goes on. You would think the demo coders would move on, but it isn't the case.
Maybe we need to organise a Computer fest in Australia, Clocks? Pizza, Beer and Atari's;-). And maybe a few Amiga's?

And I can give you this Answer the first time.

The Spectrum does not show its abilities by demos, it shows it by high quality and High End Games. Of course!

I could say a dozen games.... I am sure you know them..

Games which could be theoretically ported to the C64 and run just as well
or better.

-uso.

So the only thing you can use as a basis for comparison are games which
weren't ported to the C64?

Then you will excuse us for using demos that weren't ported to the ZX as our
example. Since the demo scene is about extracting what is possible out of
limited hardware, one can only assume that either the ZX had lousy coders or
the hardware sucked... which is it?

Quite a number are still coding ECS demos though AGA offers a lot more
scope.

It has nothing to do with the timing of the computers but the way it was
coded. I doubt the Atari version was any different.

I've been following this thread for a while, thinking it was kind of interesting (minus the name-calling). I'm a C64 fan, I've never even laid eyes on a Spectrum before, so I took a look at the list of demo screenshots for the Spectrum that you posted earlier. To my surprise, they all look pretty terrible-- after all the strident arguing you've done I was shocked at how poor looking they were. In fact, I have VIC-20 games and demos that look as good.

So, I did a little googling, looking for some more Spectrum screenshots of games I am familiar with; games that were also made for the C64. I found shots of International Karate, Winter Games, Ghostbusters and a few others. These games all look ridiculous compared to the C64 versions. Generally, they all look like plain 2-color bitmaps. Just a foreground color and a background color. Once again, I thought of the VIC-20 and how a fully RAM expanded VIC could probably produce games that look almost as good as what I've seen from the Spectrum so far.

One site I visited had some audio samples from Spectrum games. Yet again, they seemed more in line (even inferior in some cases) with the sounds I've heard from VIC-20s. Comparing them to what a SID can produce is, well, like comparing a SID to the VIC.

Don't get me wrong, I totally understand being fanatical about your system of choice-- there's a lot of nostalgia wrapped up in this for all of us-- but it seems to me a Spectrum/VIC-20 comparison is more realistic than a Spectrum/C64 one.

Or is there something I'm missing? I'm eager to be educated. As several others have requested, I'd like to see some screenshots of what you consider the really great Spectrum games and demos. What I've seen so far tells me that your obvious love for the Spectrum has pretty seriously damaged your ability to be objective about it's abilities.

It must have been different, because I simply loaded the game on my
Falcon and bingo. Only Backwards was neccesary for OS patching, not
hardware patching.

But they are no different to an A500, bar the keyboard? Wasn't stunt car racer an issue too (WB2)? We used to run an Atari Vs an Amiga using null modem, great fun. Atari had the minor frame rate advantage.

Mark

Starglider is like Christmas, it comes around once a year but most people are glad when it is over again.

Like you I have trawled through sites, watched the demos, listened to the tunes and played the games. I have come to the same conclusions that you have, the Spectrum is a limited little box a generation behind the C64.

To advocate the ZX over the C64, well I find it embarassing for them that they can't see what is plainly obvious to anyone with eyes and ears.

Hello Tom,

When I was working a lot with the Atari 8-bit computers, I used a
non-standard operating system ROM with built in monitor to tweak and test
most of the stuff. I had Q-meg, Bibomon, and Supermon installed, each
helping in their own way.

But nowadays, it's best to work with a PC based cross-assembler like ATASM.
Most programs can be found on Ken's Atari 8-bit zone:
http://atari.ksiders.tzo.com/a8programming.html but when you're really
trying to do nice things on an Atari 8-bit computer, you need to read a lot
aswell. To get some more examples on 6502 programming, I'd recommend
http://www.6502.org/source/

As far as I know, it is not yet possible to run the Mac/65 Cartridge on the
emulator, but since I don't have the cart image, I can't be sure.

Hope to have helped.

Arianne Slaager (Alphasys)

No OS patchiing required on the Amiga either, and the A1200 must just be
faster.

You have to get the right revision ROM or the onboard IDE isn't supported
(granted most have the right ROM), PCMCIA is crippled with certain RAM
expansions.

Wasn't stunt car
> racer an issue too (WB2)?

Nah, none of my Amigas ever had a problem with it.

We used to run an Atari Vs an Amiga using null
> modem, great fun. Atari had the minor frame rate advantage.

Did it, I never spotted it when doing the same. Plenty of Amiga specific
titles were dumbed down to make them work on ST ;-)

I thought it was Aussies that liked egg on Pizza? Besides the reality is
there are plenty of demos as good as each other on both machines. It
would be like comparing Coke to Pepsi. I prefer pepsi.
I have seen awesome demos on BOTH machines. In the end Atari programmers
are as good as Amiga ones.

Did you answer these?

How many mips is the A1200? 1.6? Not even close to the Falcon on its
worst day, crippled or otherwise. A 68030+65001@16Mhz combo is always
going to out do a 68020@14Mhz, especially after dropping a 68882 into
the equation;-). Does the A1200 have a copro?

Again if you concede that the A1200 can be made to appear faster than a Falcon then the same can be said for the STFM v A500. And believe me I have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth scrolling even on a stock STFM, every bit as good as an A500. One demo I saw was having a crack at how badly Shadow of the Beast was coded (ported) to the ST. It had all the elements of what Psygnosis should have done. The bitmap brothers could do it, why couldn't psygnosis.

Incedently they sorted their shit out a little better after that, because of the crappy reviews. The Amiga was useful because it showed up their programming, or lack thereof.

Mark

An '030 Amiga will kick your arse performance wise since it isn't crippled
by a 16 bit bus, and an '020 isn't significantly slower then an '030 at the
same clock speed. Like someone else said, the bottleneck in the system
architecture means actual system performance isn't as significantly better
then an A1200 (as you might not expect just looking at numbers)

The A1200 doesn't have a copro as standard but in any case that doesn't
increase system performance significantly, only certain apps that use the
copro.

> Again if you concede that the A1200 can be made to appear faster than a
> Falcon then the same can be said for the STFM v A500.

It's not a question of appearance so much as the system architecture.

And believe me I
> have seen 4096 colours (I think even 19,200 IIRC), overscan and smooth

Well I haven't, State of the art, Nine fingers, Jesus on E's... name your
favourites so I can compare some demos.

One demo I
> saw was having a crack at how badly Shadow of the Beast was coded (ported)
> to the ST. It had all the elements of what Psygnosis should have done. The

Xenon II is much better on a A500 then on an STFM.

You would like to believe that but I'm not convinced. Lets agree to disagree
;-)

F1GP-Ed fixes this...

"If you run the game at high frame rates (20+ ???), then go into race mode,
and sometimes in other modes, the car will spin to its left around its
axis. This is probably due to some calculations (the game makes)
overflowing, as it was not intended to be run at high frame rates."

From the Amiga F1GP website.

Nope, they were straight ports.

There is nothing an ST can do that an A500 isn't capable of.

And a Atari TT030 will wipe the floor with an A1200 too. But an A1200 is
no competition in terms of horsepower compared to the holy trinity of
68030+68882+65001. How many mips is the A1200 capable of? The DSP on the
Falcon alone is worth 16. That is about 10 times the A1200. Correct?
>
> The A1200 doesn't have a copro as standard but in any case that doesn't

You should see the Falcon demos that do, very nice. A 68882 is much more
potent than even an 030 at maths, and significantly better than an 020.

So because you haven't seen it, it does not exist? Well sorry it/they
do. Froggies over the fence has nice 4096 colour piccies on a STFM and
have a google for the overscan demo.

True not ALL Bitmap brothers stuff is as good as the Amiga. The Chaos
Engine is sweet on an Atari. And there are games on the Atari better
than the Amiga.

Those were the games that failed. Crappy programmers that didn't
optimise the software for the hardware. Awesome Amiga programmers,
crappy Atari programmers.
>
> There is nothing an ST can do that an A500 isn't capable of.
>

The only thing I have not seen an STFM not do that the A500 could is
stereo. There is a tweety board that allows stereo mind you. And Atari
corrected the issue with the STE, as well as hardware scrolling they
added DMA sound and increased the palette. There is nothing an A500 can
do a STE cannot.

Not in California or New York; Gay Porn is a multi-million dollar
industry.
I am hard pressed to think of where in Europe laws like that would be
enforced.
In *one* of the Middle Eastern countries, it is legal to have sex with
an animal, as long as it is male.
Ok, the last one wasn't from a credible source.

No matter where you are, you'd have to be in the public square, or
trespassing (as this guy was),
or filming the loudest gaygasm, to be caught at such an activity.

Someone should make a ZX81 demo ala ZX-Team's adult-model demo.
Pixellated buggery!!
Imagine the profits!!! Charge people an outrageous fee to UN-register
their gayware!!!

Sorry. I'm wanting to bugger the MS-SDK development team for making it
so obscure on how to
apply an icon to the titlebar of an app. Oh, and it's 3:25 a.m .

Bill Garber wrote:
> Why all you guys don't read? I said caught taping, not having sex.

So why would taping two men having sex result in a 10-15 year prison
sentence?

Moral questions aside (IMO there's nothing wrong with porn, gay or
straight, as long as everybody involved (including the viewers) is a
consenting adult), there is (judging from some of the spam I get) a
thriving gay porn industry, and AFAIK, they're not operating from inside
prison walls.

Ah.

Well, Carrier Command on the Spectrum was a full filled-polygon 3D
strategy/action game with 32 islands, aircraft, amphibious vehicles, and
actually improved gameplay over the Atari ST version.

The C64 version was a 2D affair, that lacked any impressive features found in
the Speccy version.

Starglider on the Spectrum was again an improvement over the ST version with
improved sampling of the on-board computer, and better model and animation
design of the 3D craft in the game.

the C64 version contained no sampled speech, slower animation and lacked decent
model design.

Starion is possibly the fastest Vector game on the Spectrum. The C64 has no such
game of the same speed.

They're all vector games, and they don't exactly turn us C64 owners
green with envy. The same stuff is perfectly doable at the same
framerate on the C64, especially if you limit yourself to a 256 pixel
wide window like the spectrum games. Still, 3D games are slow and
never really worked well on 8-bit machines. The Amiga and ST had some
decent 3D games, but you didn't really get interesting environments at
decent framerates until the 486 came out.

Are 5 fps wireframe games really the best action games the speccy had?

MB> always going to out do a 68020@14Mhz, especially after dropping a
MB> 68882 into the equation;-).

Of course, I wasn't arguing that. I said that the 14 MHz 68020 in the
A1200 is roughly as fast as the 16 MHz 68030 in the Falcon. Their
custom chips have different strengths, and which is faster depends on
what you're trying to do. If you're memory bound (blitting a bunch of
moving objects), the A1200's memory bus is 63% faster than the
Falcon's. If you're doing lots of calculations (say 3D graphics), the
56001 and 68882 are a huge benefit.

MB> Does the A1200 have a copro?

A 68881 or 68882 is supported, but not included in the base model.
However, if you consider the launch date and price, you should
probably be comparing the Falcon to the A4000/030, which had a 030/25
with 68882 as standard.

<puzzled look on face> I don't see how you get that. I mean, when I saw an
A4000 for the first time it was *expensive*.

My first Falcon in '92 was $799.00 - I did add a HD and some other stuff
but it still was well under a $1000 here in the US.

Maybe Atari had a special intro price in the US? When the Falcon 030 was introduced in Sweden during early spring 1993, the recommended price including a 64 MB hard disk was around 16000 SEK ($2100). As MagerValp indicated, you could find a similar Amiga 4000/030 for a few thousand SEK less. A MIDI interface was only a few hundred crowns, so you almost could afford one more funky item of upgrade before you reached the list/sale price of a Falcon.

Of course, the 4000 would not have a DSP, which IMHO might be the only hardware thing which makes the Falcon superior for its cost.

The A4000 was a big box easily expandable machine, ofcourse it cost more.

MIDI is absolutely useless without additional hardware... and subsequent
cost.

$29.95 bought you an Amiga MIDI interface should you need it, and support
was built into the serial port.

I've yet to see a 3D game from the C64 that is AS good as the spectrum version.

4523. cc65 / ca65: how to interface C and assembly?

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-06 16:02:29 UTC
From: Linards Ticmanis <ticmanis@gmx.de>
Message-ID: <4395b60d$0$9636$9b4e6d93@newsread2.arcor-online.net>
Source record: 8830
Cross-posted to: comp.sys.apple2,comp.sys.cbm,comp.sys.atari.8bit

Hello,

please excuse the cross-posting, but I thought that maybe somebody from these three groups might be able to help me along a bit.

I'm not new to the C language or to 6502 assembly language, but I'm new to cc65. I want to write a program in C using cc65, but I need to integrate a small piece of cycle-counted assembly code to do low-level disk writes with the correct timing; the Apple hardware is very picky in this regard, so it's impossible to use compiled code.

I'd like best to use inline assembly ("asm") statements inside a C frame function, but the code is not allowed to cross a page boundary, since this would destroy the timing of branch instructions; and it seems that ".align" is not allowed in asm statements. Is there any way to tell the compiler that you want a piece of inline assembly to be page-aligned?

If I can't use inline assembly, I'd need to know how to interface assembly and C code. Especially, how do I access function parameters of different data types from assembly language, how do I return values, and how can I use temporary storage in the zero page without interfering with whatever the compiled code does on the zero page. The cc65 documentation is largely silent on these matters, and while I've looked at a few pieces of assembly code produced by the compiler, I found it rather convoluted and not that easy to understand.

I understand that there's a software-implemented stack, using "sp" for a stack pointer / base pointer, local variables and parameters are both stored on this stack, and addressed with "(sp),y" type instructions, and that for a number of stack manipulation operations, there are a couple of standardized "jsr"s to library code; but exactly how the different data types are stored remains unclear to me, also how to use zero page in a compatible way.

If anybody could help with hints or with just some sample code that I could look at, I'd be grateful for replies in these groups. Given that the resulting discussion will probably be of some interest to the people in these three groups, I've not set a "Followup-To:"; if you're absolutely against cross posting, feel free to reply in just one group.

If there are any web forums or mailing lists where this question is more likely to get useful answers, I'd be also grateful for a link.

Many thanks in advance!

MV> Are 5 fps wireframe games really the best action games the speccy
MV> had?

TS> And again, Starion?

We already established that the speccy gets a slightly better frame
rate in 3D games in the first csc vs css flamewar. Starion's speed is
quite decent when there isn't too much on the screen, but a starfield
and some simple wireframe graphics doesn't make me go wow. The Masque
by Oxyron shows complex 3D objects at a nice framerate, if you're into
that kind of thing:

http://noname.c64.org/csdb/release/?id=820

As we already discussed back then, a lot of the gain is due to the
Spectrum's lower resolution - if you use reprogrammable charsets on
the C64 to build a 256 pixel wide screen you get a similar speedup,
something that C64 game programmers failed to exploit in the 80s.

That was probably the A4000/040, which costed a lot more than the 030
model.

RJH> My first Falcon in '92 was $799.00 - I did add a HD and some
RJH> other stuff but it still was well under a $1000 here in the US.

I honestly don't remember the prices anymore, but unless I'm mistaken
the A1200 was about half the price of the Falcon back then. I paid
somewhere around $500 for my A1200 in 1993.

If you're worried about where your code lives, relocate your code
somewhere else during program initialization, and jump to it. This
is essentially the approach used for assembly code embedded in Applesoft
programs. Write some inline assembly that calls the function at the
fixed address.

The way you carefully avoid interfering with zero page is to save and
restore the zero-page values on entry and exit. You won't be using
interrupts since your code is timing-critical, so there's no race
condition.

LT> I'd like best to use inline assembly ("asm") statements inside a C
LT> frame function, but the code is not allowed to cross a page boundary,

Unfortunately, this rules out inline __asm__ statements.

LT> If I can't use inline assembly, I'd need to know how to interface
LT> assembly and C code.

Sure thing, it's simple enough. The software stack is implemented with
a zp pointer called sp. It starts at the top, and moves down as items
are pushed on the stack. You can .importzp sp and access it directly,
but it's easier to use the built in library calls for manipulating the
stack. When your code is called, the arguments are pushed onto the
stack left to right. If you declare your function __fastcall__ the
last (rightmost) argument will be in A/X instead of on the stack,
which saves a few cycles. Your code is responsible for pulling all the
arguments off the stack, so if you have e.g. 4 bytes of arguments, sp
should be increased with 4 before your code exits (2 if you use
__fastcall__). The return value should be in A (lo) and X (hi). X must
be set even if you just return a single byte, as cc65 doesn't clear X
for you if the value is cast e.g. from a char to an int.

Some of the available library routines are:

popa pull one byte off stack, increase sp by one
popax pull two bytes off stack, increase sp by two
pusha dec sp byte one, push one byte onto the stack
pushax dec sp by two, push two bytes onto stack
incsp1 increase sp by one
incsp2 increase sp by two (and so on)

Here's a silly example that copies 1-128 bytes from src to dst, and
returns the length:

-- main.c --

#include "copyshort.h"

void main(void) {
copyshort(10, 0x1000, 0x2000);
}

-- copyshort.h --
```

```
/* copy 128 bytes or less from, returns bytes copied */
extern unsigned char __fastcall__ copyshort(unsigned char len, void *src, void *dst);

-- copyshort.s --

.export _copyshort ; prepend labels with _ so C can see them

.import popa, popax
.importzp ptr1, ptr2

src = ptr1 ; borrow runtime zp pointers
dst = ptr2 ; tmp1 and tmp2 are also available

.code

_copyshort:
sta dst ; __fastcall__ so last arg is
stx dst + 1 ; in A/X

jsr popax ; pull src off stack
sta src
stx src + 1

jsr popa ; pull len off stack
pha ; save len for return value
tay
dey
: lda (src),y
sta (dst),y
dey
bpl :-

ldx #0 ; return len in A/X

Actually you don't have to be. That's not the most impressive example
but OTOH we shall be _really impressed_ if you show something even
remotely similar on the Speccy.

OK. So you want the machine to have abilities w/o hardware... do I
understand correctly?

> The C64 has sprites... so does the spectrum. Hardware or not.

Does it? Or you have to simulate them in software? Good luck in getting
eight of them refreshed _seamlessly_ per raster frame.

>
> Do you understand now?

Yes. We don't take hardware into consideration and then we compare the
abilities of... what? The users' imagination?

> that is achieved.

Why can't it run a webserver then? It's mostly the number crunching
dependent. 64 doesn't make any use of its specialised VIC/SID chips to
do that and number crunching is the only thing Speccy undoubtedly can do
as good as a 64 or even slightly better sometimes ;-)

Not really - until you show the appropriate examples. Until then it's just that rather than accepting the facts, the answers are "Well, even if it is a day, I can always do a workaround like paint the windows' glasses black. This takes some time but it proves that it is not day outside"... ;-)

Really? Where's the example of "as many" and "as fast"?

> sound

Don't know what the newer Spectrums can do about the sound but I still remember the blirp, blirp, bzzt, beep of my first (and last) ZX Spectrum from 1984. Could this one play (even digitised) SID-alike tunes? Serious question.

When one is determined enough in one's faith, trivialities like
rationalization and blatant, incontrovertible facts are merely
annoyances, and can be readily assumed to be nonsense.

Or llama's, of course. For one, you can keep standing up. So if the llama does get mad, you can get away quickly. And llama's are warm and woolly too, just like sheep. Llama's do tend to spit a lot, but that might actually come in handy if the llama is of the male gender. Llama's are rather more sexy than sheep, I've allways thought. Llama's ears are more attractive too.

Unfortunately as standard there was only an empty socket in this
machine. One had to put the 68882 into it on its own, but... the
A4000/030 came out to the market later than the A4000/040 and was a
crippled/stripped to the bones version of the A4000, good for all those
who were heading for an accelerator card anyway. The 68EC030 card looked
like it's been put inside just to show that it can actually boot and is
not DOA ;-)

I personally think Starglider has issues that go way beyond system advocacy.

I don't think I'm going to be the one to defend that claim (Spectrum demos don't seem to be particularly big on sprites), but I think you'll have to quantify that a bit more to be meaningful. How many sprites are we talking about, and what size, and what do they have to do?

Still, in the absence of any further criteria, I'll claim that a 1x1 bitmap is a perfectly legitimate software sprite, and nominate Ecstasy Megademo <http://www.zxdemo.org/item.php?id=2522> which features (IIRC) 1024 individually-plotted pixels at full frame rate. Don't bother to post any sneering comments about what a ridiculous comparison that is, I already know.

>> Q. Can the Spectrum display colours at a 8x1 attributes like the C64?
>> A. Yes it can (same as above)
>
> 8x1? Ok, show that too, regardless of the 2x1 possibility on the 64

We already did (although people seemed to rather miss the point and think that I was trying to demonstrate the most mindblowing Spectrum-generated graphics ever seen, as opposed to demonstrating a simple technical point).
http://www.zxdemo.org/extra/flamewar/clive_7colour.png

I think your claim of 2x1 attributes is an exaggeration or a misunderstanding though. Firstly because someone else in this thread explicitly said that 8x1 was the limit (although admittedly I did specify the extra constraint of 'no cheating with interlace'), and secondly, if you could get two colours in one 2x1 area, you wouldn't be boasting about 2x1 attributes - you'd be boasting about no attributes at all.

I don't think there's any reason why not in principle, just that nobody's put the software and hardware together to do it yet. As far as I'm aware, the main barrier to a port of Contiki is the lack of fully-compliant C compiler.

Hey all with the wealth of software that has developed over the years
we can find on cassette, disk, and cartridge. Each has it's own place
with software that made each a valuable choice to have on your Atari
8-bit. What would you rank in the top five in each catergory?

Cartridge:

This is also one of the reasons why I went from my 800XL to an ST. When I
looked at the prices of a 520ST and the A1000, there was no comparison. I
would have had to rob a bank to buy the A1000.

I said: "*in this mode* the C64 is limited to 8x1 attribute regions.". I didn't say the C64 couldn't do better than that. Unlike the Spectrum the C64 has many screen modes and tricks up its sleeve. See also: http://www.studiostyle.sk/dmagic/gallery/gfxmodes.htm

For example with sprites it is quite easy to fill an area with more colors than would normally possible for a given screen mode.

I see no reason why a ZX Spectrum couldn't potentially run Contiki. Contiki doesn't really take advantage of the graphics and sound capabilities of the C64. Screen resolution aside, Contiki should run at least as well, if not better (thanks to the faster processor) on a ZX Spectrum than on a C64.

I'm pretty sure that there are decent enough C compilers for the Z80. The C compilers for the 6502 aren't fully compliant either. The Z80 with its 16-bit registers and larger stack, is much more suitable for C programs than a 6502.

According to the Contiki homepage there are already some ports underway for Z80 based systems. So I'm quite surprised no one has bothered to do a Spectrum port of Contiki.

According to this website:

http://www.amigahistory.co.uk/a4000.txt

and the official Commodore announcement, an A4000 with a 120meg HD was
offered at a MSRP of $3699.00 which is way over what I paid for my Falcon
with a HD.

In comp.sys.cbm Linards Ticmanis <ticmanis@gmx.de> wrote:
> I'd like best to use inline assembly ("asm") statements inside a C frame
> function, but the code is not allowed to cross a page boundary, since
> this would destroy the timing of branch instructions; and it seems that
> ".align" is not allowed in asm statements.

The builtin inline assembler is not a full featured assembler, therefore
control commands (like .align) aren't accepted. A second reason is that
the inline assembler code is processed by the the optimizer, and handling
control commands in this stage would be too complex.

> Is there any way to tell the
> compiler that you want a piece of inline assembly to be page-aligned?

Alignment is done by the linker. If you want to embed your inline
assembler code in a C function, you can place this C function in it's own
segment using something as

```
#pragma codeseg (push, FASTCODE);

void fastcode (void)
{
/* Your code here */
}

#pragma codeseg (pop);
```

Using your own linker configuration, you can the place the FASTCODE
segment whereever you like. See the linker docs for more information on
how to do this. The FAQ does also have a paragraph that talks about code
placement:

http://www.cc65.org/faq.php#ORG

> I understand that there's a software-implemented stack, using "sp" for a
> stack pointer / base pointer, local variables and parameters are both
> stored on this stack, and addressed with "(sp),y" type instructions, and
> that for a number of stack manipulation operations, there are a couple
> of standardized "jsr"s to library code; but exactly how the different
> data types are stored remains unclear to me, also how to use zero page
> in a compatible way.

MagerValp has already given a good example. I can add a few things here:

The low 16 bit of a 32 bit value are returned in A/X as with 16 bit
values. The high 16 bit are returned in the zero page location named
"sreg". If you're using inline asm, you don't have to care about the

declaration, the compiler will do that for you. If you're writing assembler modules, either use one of

```
.import sreg:zp
.importzp sreg
```

or include the file "zeropage.inc", which will give you access to all zero page locations, the compiler knows about.

The following zero page variables can be used freely by assembler functions:

```
ptr1, ptr2, ptr3, ptr4
tmp1, tmp2, tmp3, tmp3
```

But beware, other functions will also use these locations, so if you're calling a subroutine, they may get clobbered.

regbank

is a 6 byte zero page space used for register variables. It has the disadvantage that any caller expects the current to survive the function call, so you need to save it somewhere. The advantage is that you can expect to behave other functions in this way.

For more examples on how to interface with assembler, just have a look at the library sources, which can be found in the source archive.

Regards

Uz

A 48K could not play SID tunes at any acceptable "resolution", because it only has a single-channel beeper. It's something like the old PC beeper, before IBM-compatibles had sound cards. However, you can do some neat tricks with it where you play two alternating notes at high speed and produce two-channel sound, and Tim Follin managed to get five or six channels out of the beeper - although this had a *lot* of fizzy background noise to it, and was more technically impressive than pleasant to listen to. Also, nothing else could happen at the same time (except maybe waiting for a keypress).

The newer Spectrums have the AY-3-8912 sound chip, which is not so different from the YM chip in an Atari. It's not as powerful as a SID, either. It can play three channels of any combination of tone and "noise", and it can also play fairly acceptable sampled sounds while leaving some processor time free to do other things. There's a nice demo called DigiSID (http://zxdemo.org/item.php?id=6086) that plays a couple of SID tunes through AY while also running a simple scrolltext. They're obviously not 100% SID quality, because the chip is inferior, but they still sound good :)

Not all Falcon's had 68882's either. But Atari never made an 040 box
(past prototype). The TT030 I would compare to an A3000 and a A4000 to a
Hades or Milan. The Falcon was still supposed to be a home computer.

Ok are we ready for the truth now;-). Or are we still playing?

Mark

Yet you bitch about buying another monitor? How well did Cubase or
Notator run on an Amiga? The Atari STILL has the best midi timing of any
computer (thanks to the PC's open architecture) and are STILL used in
studios for that reason. Bars and Pipes, hehehehehehehe.......

Mark

PS Midi is very good at simple networking too. Try Substation or
Midimaze for example.

The Falcon has a built in line input as well as midi. Able to record at
16bits 50Khz stereo direct to disk. How about that stock A1200? How good
was its built in SCSI? 14 meg of ram? HD FDD (that runs at reasonable
speed). VGA and RGB support, resolutions I have got out of a stock
Falcon over 1280x1024. 6 joystick support analogue and digital. Able to
run virtual memory too. Cmon....

Mark
```

BTW thanks, I have dragged some of the older machines out and am
enjoying them again;-).

Being processed by the optimizer pretty much rules out using inline assembly I fear, since the Apple disk controller wants to receive a byte exactly every 32 cycles; one more or less and it won't work. So any kind of optimization or reorganization would destroy the functionality.

So I guess I'll use a separate assembly file and .align my code that way. There's no need to call any functions from the write code, it's just a simple loop that dumps memory locations' contents to the write register. And now that I know how parameter passing works, it should be easy enough.

One more thing, on the Apple many hardware funktions are activated by accessing certain addresses. It's only the access that matters, the data read or written is irrelevant. But when I use peekpoke.h and say something like "PEEK(0xC030);" without using the result for anything, it gets optimized away. I've settled on "*((char *)0xC030) = __AX__;", which gives a "pure" store, storing whatever is currently in A; but this is problematic for some addresses, since the 6502 accesses an address twice during a write. Some of these "softswitches" are toggle switches, so you need to read them, which produces only one access; writing them toggles them back and forth instead.

Is there any way to get a "pure" load, i.e. make the compiler emit just an LDA (or a BIT, or whatever) but to ignore the result? I mean without resorting to inline assembly. I tried to do it with "volatile" but that doesn't seem to have any effect.

(No need to answer this rather peculiar request, unless you feel like answering. I know I can just store the result to some temporary variable and forget about it, it's more or less a question on whether it's possible.)

For obvious reasons IMHO ;-)

I think it's been said already. The C64 sprites have decicated size of 24x21 pixels (that's to answer the "size" question). Let's keep it so simple and small then. They have to be moved on screen without affecting the underlying (or overlying) graphics (no colour bleeding at all, regardless of the colours chosen for the back/foreground vs. sprite). They have to be moved on screen without _any_ noticeable jitter (raster synchronised as not to get distorted). They have to do the above and be in a number of - let's make it easy - 32, updated every frame. Of course I'd love to see the 100+ (was it?) record of the 64 being beaten on the Speccy while fulfilling the above criteria of "as many" and "as fast".

Yes, I already admitted that I was wrong (not up to date) here, provided
it's possible on every regular Spectrum and not only on the newer
clones/models

You are right. I put it wrong. I was actually referring to the simple
"multicolor" mode, which combines two adjacent square pixels into one
with the addittion of extra "colour depth" and allows without any tricks
(read: software support exceeding initialisation) to display four
colours in four adjacent pixels. After adding the simplest "trick"
different colours can be applied to every line. Somebody already gave
the link to the article explaining the display modes on the 64.

That's what I refer to. IMHO Spectrum actually _can_ run a webserver. At
least I don't see any major obstacle for it to be done that would be a
result of the platform's limitations. Funny is that this was agreed as
impossible while things that are most probably not really possible
(sprites, more advanced gfx display) are claimed to be the ones so easy
achievable...

Reminds me of the wav sound driver for the PC speaker, it too took a lot of
CPU and sounded fuzzy.

Monitors were damned expensive. $29.95 for a port that only a minority of
people would have a use for is pretty cheap.

How well did Cubase or

You would like to think so, but I see Mac's and PC's everywhere in studios.
The days of the Atari being a choice for the semi-professional+ are long
gone.

Simple being the operative word there.

Not so, alot of sudios still use them as a master midi clock IIRC.
Because the timing is so poor on modern equipment. So, how well did
Cubase run on an Amiga anyway?

$29.95 is peanuts for those into MIDI, it would be the least of their
expense.

Professionals seem to be happy with it, I think

So, how well did
> Cubase run on an Amiga anyway?
>>

It doesn't, MIDI was the domain of Atari where Video was the domain of
Amiga. Despite that the MOD tracker format was by far and away much more
popular then MIDI anyway, and spawned many a talented musician.

Hmmm, "I" does not ring a bell. How about C.Itoh? Pretty sure they
made printers and monitors back in the day.

Anyway, thanks for the help plus you've just given me one or two more
fond memories.

There is no comparison between Mod and Midi. Especially when you get to
Cubase audio on the Falcon. I think there was a version that ran on the
ST/Mega/TT as well, using an external SCSI sampler.

So how many albums were recorded using the Mod standard? Midi was/is
more popular than Mod has/ever will be.

Mod was/is very popular on the Atari too. I found an scream tracker
player for the STE yesterday. Awesome stuff. Seems a mod player for the
STFM has been released recently too, capable of 50Khz playback. The guy
who wrote it (Paulo Simoes), would be the guy who wrote the fist
overscan demos in the 80's and has recently broken the sprite record on
the ST. He deserves a medal I think.

You do know that a stock STE is capable of 50Khz DMA stereo? Mods are
not an issue for anything made by Atari after 1987. STE, MegaSTE, TT and
Falcon.

That's because the Atari's YM chip is an AY8910 clone.

A volatile type would be great. I have a program that suffers from a
similiar problem, in that I store a value to a memory location to check for
the presence of hardware. If I check for that value in that location right
after the assignment, the optimizer optimizes it away. I got around it by
putting the check far enough down in the code from the assignment that the
optimizer doesn't remember it.

Here you go...

ftp://ftp.atari.art.pl/stuff/mirror/atari.fornax.sk/pub/atari/8bit/Emulators/co
mp/800xldj.lzh

That is on the XLSearch site.

800XLDJ uses an SIO2PC cable to have the Atari ST/TT/Falcon (Well, I've at
least gotten it to work on a ST and STE) to act as a virtual drive. Some day
the images drop off the last bit, and the program uses a .DI format. However,
that aside, works great! At least worked great for me.

Haven't used that since like 2000. I got a cheap 75 mhz laptop and ran the
dos based version of Steve Tucker's APE program. But in a pinch, 800XLDJ does
alright.

It's possble. The Falcon is a strange bird.

But with all ST's I found that the "drver" program, or some serial port
patch was needed since the ST had a few odd serial protocals. That is, you
needed this patch to get the serial port working reliably at or beyond 9600
baud.

A good question. I have run my SIO2PC cable at the end of the SIO chain.
I have run into problems only when I tried to add other devices that didn't
have another SIO port on it.. like the 410 tape player and some printer
interfaces.

I hope that the optimizer knows enough to leave assembly code
unchanged. I presumed (oops) that UVB meant only that it "passed
through" the optimizer, not that the optimizer attempted to do
anything with it... ;-(

It is not true that all stores cause a read access. I don't know how this myth continues to propagate. (Perhaps it's because of the "double access" note about the Applesoft POKE function, which occurs because that store is *always* indexed.)

Only indexed and indirect indexed stores cause a read access prior to the write access (because of a data path conflict in the chip which requires another cycle).

A volatile type is a necessity in any optimized language used to
access addresses when the access has side effects. As noted, the
Apple (and indeed, any 6502 machine) is loaded with such side effects.

One must also make some "policy" decisions about indirect accesses
(through pointers). Without explicit information to the contrary,
it is best to assume that a pointer *cannot* point to a volatile,
since to do otherwise would eliminate almost all optimizations.

Thanks. I was indeed thinking that every store instruction causes two
accesses. If not, the solution I gave above seems to be ideal, provided
you use an absolute address, not some expression that has to be
calculated at runtime (which will compile into an y-indexed indirect store).

Message-ID: <qzBlf.151960$dP1.509792@newsc.telia.net>
Source record: 8878

It has been a while since I found anything interesting on local flea markets or the
various web marketplaces in Sweden, but I bought Adventure International's Sunday Golf for the Atari recently.

The box and the cover/manual really looks pre-industrial seen from a computer
gaming point of view. Simple cover art with a golfer and instructions text printed on the inside of the cover. If the cover art had not been in colour, the compact cassette box and the cassette itself would have looked quite home made.

I like that. If I decided to concentrate on collecting something in the classic computer games arena, it would probably be things that have signs of small scale business or computer hobbyist achievments.

Here is a web page (not mine) with information about the game.

Note that for the switch to write mode in your disk write code:
(B83D) LDA #$FF ;(a) = sync byte.
STA Q7H,X ;Write 1 sync byte.
that STA abs,X (with no page crossing) is pretty much essential.
It syncs with the Woz Machine. You can't replace it with a STA abs.

This is covered in obscene detail in Sather's Understanding the Apple
II.

Just to expand on the double write issue, various 6502 ops
perform from 1 to 4 reads and writes to the given address.
Read-modify-write ops always perform two writes.
Read-modify-write,X ops perform two reads, two writes.

65C02 ops perform 1 to 3 reads and writes to the address,
and the read-modify-write ops only perform one write.

Ah, the Apple II. The more you look, the more there is.
It's like Natural Philosophy, or something. ;-)

Cheers,
Nick.

The 48K should be fine, other than missing out on the AY sound. What's
the problem?
```

In high-level languages, optimization is often necessary to allow
more efficient execution of natural expressions of algorithms.

For example, a loop counter may be kept in a register, even
though it is expressed as a variable (typically in memory).

Of course, if you like the compiler's unoptimized code, then you
can turn optimization off.

I had an Acorn 3000... it sucked.

I used the monitor for my Amiga 2000 though so it was good for something.

No, I did use it for a while but in this country there was virtually no
support for it, that sucked. It didn't really do it for me, though the OS
did look good and was pretty fast.

No, I like plenty of older systems, like the TRS-80 for one. Amiga was my
main focus at the time, and it was a nice (Acorn) monitor.

Hm, is the regular BASIC LOAD "prgname" enough or is there a special way
of loading some prgs on the speccy like on the Ataris, you know... this
one with this and that one with that and the other one with something
yet else... ;-)
```

LOAD "" is the standard way used for 99% of Spectrum programs - if you
don't specify a program name, it'll load the first thing it encounters.
To get LOAD, just press J; " is symbol shift and P (ctrl+P or alt+P on
most emulators).

For demos that need 128K, the standard procedure is to select 128K
Basic, enter usr0 , then load as above.

OK. That's what I thought. Shall check a different emulator maybe.

Yes. That I still remember from 1985 when I had a Spectrum for a short
time ;-)

I am auctioning some of my more unusual games this week, due to financial circumstances. (such as my car getting ripped off...merry christmas!) I rarely post auctions anymore but in this case I have some very unusual stuff for auction and I would like to make sure some hard core 8-bitters like myself are aware of it.

These games took me forever to find, and I have only seen one instance of them ever, in all of my travels to classic game expos, talking to collectors online, scouring Ebay in every country etc. These are both near mint and complete, tested, and work great!

I think I can safely say you will never see these again on Ebay!

http://search.ebay.com/_W0QQsassZsatcom2QQhtZ-1

Thanks for looking and happy holidays!

OK I have discovered that I have several brown Atari 800 games (Qix, Basic, Star Raiders, etc) that have two socketted chips inside! 24pin. As you all know, most are soldered so this is nice. I assume these are 2732 4K each? I was thinking of burning some binary game files to Eproms and making my own cart. What kind of Eproms can I use? Can I use larger ones and just duplicate the code like on other systems to make it work? What if I want to use a 16k file? What all Eprom types can be used with these PCBs.

TIA,
TJ

I'd only being guessing so I won't do that.

I have noticed that some of my Atari cartridges are missing "fingers"
on the edge connectors. Don't know if would affect addressing of
larger ROM sizes since I don't know the pinouts.

There are some threads over at AtariAge.com about DIY cartridges plus
AtariAge sells blank cartridges which hold 27128 (16K) EPROMs. Pretty
cheap too. Certainly an easier starting point than hacking 24-pin
sockets.

Those older brown carts are more likely to contain masked roms than eproms,
and you cannot replace one with the other unless you make modifications to
the boards. As I understand, some of the later carts may have eprom
boards, but none of the brown ones I have opened have them. I recently
purchased cases and 16K boards (specifically for 2x2764 eproms) from B&C,
and they also carry the matching eproms. If you want to burn some games,
you might give that a shot.

Works great too. I have made some and have quite a few more
boards, cases and eproms to make some more. I think I got mine
from AtariMax, and plan to get some more. I've got a load of
cart files downloaded, but am so busy with my Apple II stuff
that I don't have the time or space to get Atari set up now.
Soon as I do, I'll be available to assist anyone who needs
help with their stuff. :o)

Where can I buy the parts to do that? I have a EPROM programer, all I need
is cases, boards and the chips I can find online. I checked Atarimax and
all they have are the Flash carts not what you mention.

Thanks that is exacty what I am looking for. I see that hey 2764 and 27128
EPROMS for the boards, but if I order the 27128 EPROMs and want to put a 8k
game on them can that be done? Or do I need to get a 2764?
Thanks
TJ

These guys have the boards.

http://www.atariage.com/store/index.php?cPath=45&osCsid=aa09356132a48c5e88772919dbd732ef

Lots of cart files available here.

http://www.atarimania.com/lst_soft-MENU-8-TYPE_CODE-G-JEUX_ID--VERSION_ID--Page-1-ADV-0-VERSION_CART-1.html

Also, Best Electronics has lots more, but you have to buy
their catalog as many of the items are not readily accessed
through their web pages. Looking for the link to their home
page.....

Here it is:

http://www.best-electronics-ca.com/

Good Luck.

You can either insert a 2764 into the socket, or double up the 8k file so that it burns onto the lower and upper half of the 27128. Will work fine.

With the proper address lines switchable, you may even be able to put one 8k game on the lower and another 8k game on the upper and have 2 games in one cart, using the 27128 eprom. :o) This is done quite often for different firmware on interface cards in the Apple II. The CFFA IDE card is one example of this.

I don't really know I'm a newbie but AFAIK the 27128 simply has one
more address line. If worse came to worse couldn't you tie A13 to
ground thus limiting the cart to 8K.

Checkout the message threads at AtariAge. I'm pretty sure I read about stuff like what you ask, as well as DIY multicarts, and banking multiple games.

I'm actually just starting out myself with banked OS ROMs. I was planning to piggyback an SRAM over an EPROM. The project is to be a simplified version (at least in my imagination, LOL) of Bob Woolley's SmartOS. I wanted to use a single selector switch instead of toggles and drop the internal cartridge emulation and $D600, $D700 features. I just want the software programmable OS feature and nothing else.

I just like the idea of software programmable stuff and non complicated hardware mods.

I'm off to a bad start. My EPROMs don't even work in my 800XL and I didn't even get to the stacking yet. LOL.

I told you I"m newbie.

LOL!

- Steve Sheppard

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

That sounds great. It is alot better than what I paid for my Atari clone, the Hades 060, which was some where around $3500. Still, it was worth it as it still works and functions great for me today.

An 800XL or 130XE would be a better choice. The 800XL is just about the easiest machine to upgrade since most have socketed chips.

About the most popular interface is APE which allows a PC to emulate normal disk drives.

http://www.atarimax.com has details, as well as flash memory, IDE and USB interface cartridges.

$3500 US?

Is it true that the MIDI timing is nothing like it was on the real Atari's
and there have been lots of compatibility problems or is that the Milan I'm
thinkling of?

All three of the ones I have DID NOT have socketed chips... I'd be
suprised if the majority of the 800XLs had sockets.

I desoldered all the main chips from one of my 800XLs and put sockets in.

Hi Shawn-

What was the origin (manufacturing site) of your 3 soldered XL's? My experience has been that Hong Kong XL's were socketed, and only the Taiwan XL's (the last major run of post-Tramiel XL's) were soldered. Many Taiwan XL's also had Rev. "C" BASIC.

Yes, if you look at the pinouts of these chips (try www.chipdir.org)
you'll see that most of the pins match up, even between 24-pin chips and
28-pin chips. It makes exchanging one chip for another or stacking them
fairly easy.

Micheal how come the faq still does not reflect the additions (re ntsc
65xe wiuth ECI) that we discussed? Just wondering how long it takes
to update the faq (both the august and oct additions dont include this
info)

Thanks
Kevin

I wonder in the ARM series if the Newton 120 or 130 could compare? Those
were fairly good, though it was like using a palm sized Macintosh Plus.

4625. ABBUC USB Coding Workout Report

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-12 09:50:00 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2005.12.12.09.50.00.60269@strotmann.de>
Source record: 8982

Hello,

Thomas, Harry and me have been hiding in Frankfurt last weekend for an day-and-night USB coding workout. Only living from bean-soup (Harry, this was great!) and christmas cookies, we created a lot of new USB code:

* Harry has extended the SIO2USB Utility driver

* Thomas has been working
on routines to read the directory structures on a FAT 16 formatted USB Stick

* I have added USB Storage routines to the USB Test program. We can now access some USB Sticks and can read and write sectors. In our case the Apple iPod Shuffle was working (Who will volunteer to write iTunes for AtariXL ??)

The new USB Test Program will be available during the next days on Sourceforge and on the MicroUSB Project pages.

We made some pictures:
http://www.strotmann.de/twiki/bin/view/Mic...jUSBConvFivePic

Best whishes from the ABBUC RAF USB Team!

The FAQ gets auto-posted here in the newsgroup every 60 days. Each time it gets posted here, the web mirrors in turn automatically update with the version that appears here.

I updated my working copy of the FAQ with the NTSC/65XE/ECI info from you on 9/5. The FAQ was next auto-posted on about 10/25. Unfortunately, I had neglected to upload a new copy of the FAQ to the auto-poster since the previous posting, so the version that appeared here and was mirrored on the web on around 10/25 was actually the version that I last revised on 8/15. So that's why the info from you isn't there yet.

The FAQ is next scheduled to auto-post on around 12/25 (merry Christmas!), 60 days after the last one. I've already fed the auto-poster with newer versions a couple times since 10/25, so it will definitely include the info from you, along with a number of other updates. In fact, here's a little "preview":

UPDATES SINCE PREVIOUS POSTING
2005.11.27 8.1 updated to revision 2.0, 2005-2-20 from Freddy Offenga
2005.11.27 7.1 updated to Version 3.4, 2005-11-26 from Freddy Offenga
2005.11.27 6.8 The Entertainer variations, thanks Bill Demian
2005.11.16 1.11 added custom IC part numbers from Best Electronics catalog
2005.11.14 1.11 added link to http://www.retromicro.com/, thanks Kryten
2005.11.08 2.1 More Than Games link updated
2005.10.28 1.11 datasheets & schematics missing from revised atarimuseum.com
2005.10.15 11.2 1.2 1.3 3.4 800/810/400 production ended May 1983
2005.09.09 3.9 added SIO2Linux, by Preston Crow
2005.09.05 1.7,1.12 some NTSC 65XE's include the ECI port, thanks Kevin
2005.08.26 11.2 JAKKS Pacific and Atari Flashback annoucements added
2005.08.15 11.2 1983 1200XL, 800 retail prices

Thanks,

-Michael

If you have the equipment and know-how to make your own PCBs I can send you the plans for the 27128 EPROM Cartridge. I have made several for my 800XL and swap the games/utilities on them regularly. You don't have to fill the EPROM so a 27128 EPROM can take a 4K / 8K or 16K program without any modifications. Let me know if you want the plans...

Yes David is still very happy with his Hades as far as I know. You are correct about the Mac. If anything seriously happened to my Hades I would probably get one if I had no other options.

Yes, it does. I think the only limitation is the power that the motor requires.
In fact, I think they were TEAC mechanisms fitted into the XF-551 casing...
But right now I don't want to open my XF-551s to verify it...

I tried using the Teac "IBM Style" drive in XF551. The power cable is
connected from AT Power Supply. I do not use the power from XF551 circuit.
When I turn on the computer, the motor in the disk drive is running but
there is no busy light and the Atari Single/Double Density disk can not be
read. I think the most mechanisms do not work with XF551. I think the
special mechanism is designed for Atari XF551. Like the oldest disk drive
from VAX microframe work with IBM AT but DOS formatted disk can not be read.
Oh well...

Been forever but...

Not only is the standard drive a low powered one, it is also jumpered
differently then an IBM style drive. Remember how the IBM used a
cut/twisted cable? I think that was so both drives could be jumpered as
D1: for an XF551 I'm pretty sure you have to jumper it as D0:

IIRC, the XF551 mechanisms were made by Mitsumi, and there was something
special about them. For the life of me, I can't remember what...

From: Larry <LLppwhite@aol.com>
Message-ID: <1134561962.286762.43390@z14g2000cwz.googlegroups.com>
Source record: 8999

Hi Guys-
Good to hear from you Marco!
I've used several "modern" 360K drives in the XF551 case. I've also seen a HD 1.2 mechanism installed, but naturally ran as a sort-of 360K. Atari also used more than one brand of drive. Jumpering *is* an issue. IIRC, my stock Mitsumi had to be jumpered as device 1 rather than device 0 for it to be D1: in the system. The other issue that pretty much always comes up is that the 34-pin connecting cable is too short, since most drives connect on the opposite side from the stock mech. But easy to lengthen with an adapter cable. But when its all said and done, IMO the best use of a 551 is with a 720K mech. Twice the storage, no/fewer compatability issues, very low power requirements. Of course, that may not meet your needs. Incidently, look into HyperXF. -Larry

4643. Re: Trak and Astra read other side?

The TRAK model you mention is single-sided, so no. Not unless you have a modded 551 (or use "flippy" disks with 2 timing holes in the *jacket*.) In that case, you would be using the 551 to write double-sided 90 or 180K disks. Astra did produce some 360K models, but I *believe* they did not use the same format pattern as the 551. The FAQ's might have some info on this. -Larry

4644. Re: ABBUC USB Coding Workout Report

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-14 21:04:35 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2005.12.14.21.04.35.283341@strotmann.de>
Source record: 9001

Hello,

the new USBTEST Version 0.6 disk is online at SourceForge
http://sourceforge.net/project/showfiles.php?group_id=111428

New features:
* Get Descriptor Routines and Display are now working with more USB 2.0
devices

* faster Routines to move data in/out of the USB Controller
buffer, using Cypres SL811 autoincrement

* USB Storage Sub-Menu

* Function to send SCSI Device Inquiry

* Function to read SCSI Device
Capacity

* Function to read SCSI LBA (Sector)

We would like all owners of an Atari USB Cartridge to test USB Sticks and
Harddrives with this new release, so that we get an Idea how good the
current code is.

Please test and send us information:
1) if the device can be attached
2) if the device descriptor page can be retrieved

3) if the Device Strings
are printed

4) if you can access the device in the SCSI menu. For this you might need
to adjust the endpoint numbers for the in/out endpoints. You can get this
information on Linux using the "lsusb -v" (from usbtools) command to
display the descriptors of all attached USB devices (on windows you can
use USBCheck.exe). In the next version of the tool I will implement
reading the configuration descriptors and setting the correct endpoints.

I will collect all this information and will post the result on the Atari
USB Device Driver Matrix Page:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartAtariDevMatrix

Best regards

Carsten

That's correct. I have a Big D with one DSDD drive in it (the other one is SSDD). The disks are not compatible with the DSDD XF-551 disks.

Message-ID: <6rKdnUfz7ch41TzeRVn-rg@comcast.com>
Source record: 9005

While I'm a diehard user of the original equipment, I wanted to give an emulator a whirl, mainly to see what kind of speeds I get out of Mac65.

I chose the Atari800 emu for Linux, but I'm having great difficulty finding the OS & BASIC roms. I found some BASIC roms, but I have no clue if they'll work or not until I get the OS.

Do any of you guys have the roms or know where I can get my hands on them?

Thanks,

4653. Re: Trak and Astra read other side?

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-16 02:10:53 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <Ympof.29222$QW2.14094@dukeread08>
Source record: 9010

Many disk drives have 3 ways to read the other side of disk.

Number one is XF551 reads the 1st track to 40th track on first side, then reads 40th track back to 1st track on other side.

Number two is like 1571 method, (CP/M), the drive reads the 1st track to 40th track, then the head moves back to 1st track as Number 41 track, reads 1st track to 40th track on second side as Number 41 track to number 80 track...

Last is Today's PC disk drive reads 1st track on upside then downside, next track on upside then downside. so on....

I am curious... Which method does Trak AT-D4 use?
Astra the One ???
Astra Big D ???
Concorde C-222M ???
Percom RFD44-S1 ???

Do you know?

Thanks!
Jack

Actually, you can use a modern PC for that. I saw a website once (tried to find the link, but alas, I couldn't) where it showed 10 things to do with that old PC. There was the fish tank, the hamster cage, etc. But my favorite one was where a guy had the side off of it, sitting on a stump and filled with charcoal while bar-b-que'ing shish-ka-bab's over the fire. I laughed my butt off when I saw that. I mean, I work in a computer store and everyday people bring in these old computers (IE: 486, pentium 75, etc..) and ask me "what can I do with this?" I'll usually roll off quite a few uses like "Well, you can use it as a door stop, or a boat anchor, or put it behind the tire of your car when you're changing the oil, use it for a step stool, or a camping chair, target practice with your REAL gun, a foot stool in the living room, a night-stand, the larger ones can make good coffee tables, etc.." I can go on for like an hour with uses for an old computer.. People just stare at my like I'm nuts. Then they will sort of insinuate that they are wanting to use it for some kind of computer related task like running Office XP or something. So I tell them, "Oh.. its no good as a computer, but it can doo all those other things." But now I also get to mention that it can be a bar-b-que grill or a hamster cage, and stuff like that.

I've been posting in comp.sys.cbm since 1995. Only 3-4 posts that I've made in 10 years fall under those "kooky" guidelines. The rest are CBM related. Google it up if you don't believe me. Search from 1995 to 2005.

Paul

I can imagine. Do any of his posts relate to adventure games, in particular
trying to beg someone to do a C64 port of his adventure?

D.

Hmmm. Slick. Probably give that a whirl tomorrow after I get home from work.

I downloaded the roms and A800 nearly drove me insane trying to figure out the path for them. So I thought I'd give the windows version a spin. After examining the cfg file for the windows version, I realized that I had to point it at the directory AND the filenames for each individual rom for it to work, not just the directory. Nice tidbit of information to exclude...

Anyways, so far I'm not that impressed by the A800 emu, and I would vastly prefer using my real machine where I have a real Atari keyboard to use, if you wanna call the XE KB a "real" one... I guess it's a good emu if you don't have a genuine machine, but for the hassle of screwing with it anytime I wanna enable/diable BASIC and the various other options it has.

Maybe I just havn't found the setting for it yet, but A800 doesn't seem to be able to run any faster than a genuine 6502.

And the joy I get out of using the exact same computer I have had since I was 5, only pimped to the extreme with a 19" VGA monitor, hard drive, and a buttload of hardware my parents could never afford just has a level of coolness an emu can never match.

I see one very good use for it so far. Using it to test compatibility with the other Atari's. I don't feel like digging out my Dad's old 800 he bought before I was born just to debug a program.

What are my options for a Linux or Windows based 6502 assembler? The Mac65 assembler is great, but just too darn slow for those massive programs.

Thanks guys, just another obsessive Atari user who enjoys using a computer that's as old as I am. :)

"Popular" in what way? Also, "popular" != "better. Look at EA's console games for proof of this.

Hi everyone,

Thought I'd stop being a lurker for a bit.

Been an Atari user since 1982, and I've recently had to go
full-emulation due to a couple of dead Ataris, (an upgraded 800XL and a
1200XL). Well, at least until I have more money...giftmas is eeeevil.

It's always nice to see another emulator that runs under Linux. I'll
compile it after work today. :-D

I'm currently running the atari800 emulator which has a debian package
for the kubuntu distro I'm using. The atari++ emulator looks like it has
many of the same compile requirements.

The best thing about running an SDL-based emulator under Linux is that
when if/when it croaks the operating system just shrugs, you kill the
app and try again. For Windows...eh, not so nice.

For those who are familiar with keyboard issues...
I've been running into problems with remapping the emulator keyboard to
permit keychords like the Action! "shift-ctl-M" and "shift-ctrl-E".
Running the Action cart without those keychords is just not possible.

Anybody get this right yet? Please share your wisdom, a link to an FAQ
I've somehow missed.

Worst case scenario, the "Linux Finger" solves all problems.
alt+ctrl+backspace and presto, you're back at the display manager login and
whatever nastiness caused the cock up is gone!

Lol. That was one of my next issues to address with A800. I havn't gotten
far with it yet, but I was getting annoyed trying to map out my keys.

One thing I've never truly understood is this: if the C64 was so popular,
then why is the C64 retroscene so different in character to the Speccy
retroscene?

Vague question, I know, but still...

I think it has a switch for allowing it to run faster, so does have
atari++.

> assembler is great, but just too darn slow for those massive programs.

My recommendation would be the ca65 assembler, part of the cc65 C compiler.
You should find it easily when googling.

So long,
Thomas

If you are already familiar with the Mac/65 assembler, I'd recommend
using ATasm. The syntax is Mac/65 compatible and it's available as
a precompiled .exe for Windows and also in source code.

I've been using ATasm under Linux for all of my Atari-projects for
quite some time now and it works very fine.

so long,

Hias

Do you mean as in not nearly as advanced in the retro scene? I know that sounds
like a flamebait comment, but I do look at the C64 retro scene, and it's tiny in
comparison.

I mean you have not the slightest idea whatď˙ż˝s selling. The customers
you write about may think they are in a dream-store, after telling them
the uses for a 486. They only tried to check if you are even willing to
advise something useful. ;-)

I know 486 User in the Usenet and have refreshing conversation with....

Well, P75. I would suggest Win95 and Office 97. Not to mention the
plenty of (pssst abandon..) DOS Software. Dear Sir/Mam you should at
least keep your Door-Stop for such purposes. etc etc... and make one
over that and say: But donď˙ż˝t forget your P75 may be too fast for some
games, though Office and Co. makes no problem... but only office 95 or
97 (97 I would suggest you as it is still used by offices and can read
MS Office-files) ... after that he/she can get interest for a faster
machine capable to drive XP and OfficeXP. But the possibility is always
real, that he/she wanted no new computer at all, this time. But after
telling about Door-Stopps, Anker, Baerbque-Grill and Hamster-Cage I
donď˙ż˝t think that you will see this customer, in the same store, again.

Use you fantasy for interest and not for making something bad. At least
for selling more... :-) well? Right enough?

> stool, or a camping chair, target practice with your REAL gun, a foot

> 1. Best selling computer of all time.
The Windows PC. But I think we can all agree that it's rubbish.

> 2. VIC-II/SID chip.
Can be approximated an AY chip equipped Spectrum by using the Z80 to add extra square waves to the standard sound channels. I suspect this would be even easier on the Atari.

> 3. Thousands upon thousands of programs.
There are more programs for the Spectrum. I don't know about the Atari. I do know that most of these programs (on all formats) are absolutely god-awful. It's the gems that we remeber fondly, and there were probably about the same number of those on all formats (including the BBC micro).

> 4. BBSs.
As has already been mentioned this is not a feature of the C64. Just like the internet, BBSes were platform independent. Perhaps the poster is refering to the large amount of C64 software that was available for illegal download. The availablity of this software and the willingness of people to break the law may account for the popularity of the C64. It certainly accounts for the popularity of the Windows PC.

> 5. The most popular computer of all time.
This would be refering to the Guinness book of records entry I suppose. That entry simply refers to the fact that the bog-standard C64 had the biggest production run of any computer ever. So what? The bog-standard VW Beetle had the biggest production run of any car ever. I doubt many would argue that the VW Beetle was the greatest car of all time, although granted some enthusiasts probably would.

In the last cross-platform thread I asked what happened to the cross-platform development of a side scrolling shooter that was being written for the C64, Vic20 and Atari. I didn't get an answer. Does anyone know what happened to it?

On the subject of cross platform development. Someone mentioned that the C64 has an 8x1 attribute mode but I forgot the resolution. Is there a similar mode on the Atari? I should probably cross post this to comp.sys.amstrad.8bit as well because I don't know if the CPC has this mode. The reason is I'm working on a game for the Spectrum SE and I'd need some help. No one in the Speccy community seems to have the time, but if it became a cross-platform development there might be a bit more interest. It's not going to be processor intensive so it should be do-able on any 8-bit platform with a disk drive (or sufficient memory

for a tape load). Would probably look at selling it through Cronosoft. Obviously the Spectrum SE version will be useable on emulators only (since there's still only one in existence). Drop me an email if any programmers amongst you are interested (that includes anyone prepared to work on the Speccy version). All I can say at this point is it's a top-down RPG.

dun...@yahoo.com did eloquently scribble:

> 1. Best selling computer of all time.

Best selling computer of all time of one model of computer. IBM PCs
have sold more as a whole but not the PC, XT, At etc as a single model
with consistent specs has outsold the Commodore 64.

> 2. VIC-II/SID ship.

Back in 1982 a sythesiser was something no other computer had. And it
took years for the PC with it's internal beep speaker to get a quality
sound card to rival the 64.

> 3. Thousands upon thousands of programs.

-Big deal, so what?

Choice, variety. There were programs for just about everything on the
Commodore 64, accounting, word processing, etc. There are now web
browsers for it.

> 4. BBSs.
-Yes, yes, still nothing special
To many they were it was a great community if you ever were there.

> 5. The most popular computer of all time.
-Hah!

a)see #1
b)search for Commodore 64 on Google and see how popular it is.

Well, what you don't understand is that I work in the service department. So I'm not out selling computers. These people are bringing in their computers wanting them to be repaired. They often picked them up non-working at garage sales for $5 and stuff and think they're going to get them repaired for $10 and have a perfectly working computer. They have every intention of having us install Windows XP (which they believe is free, they just have to pay us to put it on there, yeah right.) So once I tell them that all the upgrades to make their computer XP compatible (parts and label) end up being around $400 and XP itself costs $149, so they are lookinng at an upgrade cost of $450 or so.. then I explain that they can actually BUY one of our brand-new Dell systems or a slightly used system with XP already on it for like $250, then it suddenly makes more sense.

Yes, I perfectly understand that an old computer can be used online. I myself use a laptop computer which is a Pentium 133 quite often (although my computer on my desk is 2.53 ghz because I have to do video editing) My 133 laptop runs Windows NT 4.0 and I run a variety of programs on in which are older or use low memory. If I didn't need to do video editing, I could use it as my main computer. But the difference is that I understand what can and cannot run properly on a Pentium 133. I also know how to keep all the programs out of my startup group and I know how to keep spyware and viruses off so that it runs fast. But most people don't. You hand them a Pentium 133 and they will want Windows XP and Office XP and 200 pieces of spyware and everything to be in their startup group and the system will take 20 minutes to boot to the desktop and they will complain that it is slow.

Action! is the language of choice for me. Back in the day, it was the only A8 compiler that was fast enough to be tolerable plus it used a simple syntax (I can't comprehend C) and the performance was good too.

I noticed from one of your other posts you are trying the Windows version of Atari800. Might I suggest Atari800Win Plus version 4 (see link). I love this emulator for use with Action!. You can map the CTRL-arrow combinations to just the arrow keys. CTRL-Shift-up/down arrow (Action page up/down for those who don't know) becomes Shift up/down arrow and CTRL-Shift- R/T/M work as expected.

One problem. This emulator does not work properly with the combination of Action! and SpartaDOS. The key repeat feature goes haywire. I prefer MyDOS so this isn't much of an issue but If I do need to produce SpartaDOS disks/images I boot Bewe-DOS instead of SpartaDOS..

The H:drive of Atari800Win Plus allows you to use your PC hard drive and this feature works well with Action! but I do wish the virtual H: drive could be mapped to D1:...D8: for compatibility and transportability of my Action! code (e.g. I have to change my H1: references in my Include statements to Dx: references so I can compile my code on the 800XL) . Using H6: thru H9: make it easy to import ASCII sources, just drop them into the appropriate folder, but Atari800Win Plus expects lines terminated with LF (line feed) only ala Linux. It doesn't tolerate the CR/LF combo which always appear when cutting & pasting from a webpage.

Game controller options are quite flexible but I just don't like analog joysticks with A8 games. Off-topic, but I much prefer the old, digital game pads for most games while the ultimate, old-time enjoyment can be had using the DIY PPJOY (parallel port/joystick) for Atari type joysticks. I hear Stelladapter (something like that) is quite good as well.

Looking ahead to a couple of your other posts...

Can't help you with cross assembler recommendations. Assembler and Linux are two other things the my little brain doesn't quite comprehend. LOL!

Your dad purchased an 800 around the time you were born! Yikes! I feel old!

When I purchased my 800 (in 1979) I put off replacing my first car (of one year) for just a little longer. That first car cost me $800 (a well used '72 Plymouth). That 800 (with 24K of memory) was $749

(discounted, new). The car is long gone but I still have the 800 and it still works and I still love it. It has the best A8 keyboard (IMO).

The big deal, so what implied that there's nothing special about "thousands
upon thousands of programs"
Cos there isn't. The spectrum also has that.

>> 4. BBSs.

Every Windows User is a good User. Economical seen.

To even think about if people are paying for Windows or not dazzles my brain. If I want make money out of something, and with something software, then I pay for it (ie. OfficeXP2002 and making invoices with it). Windows I have bought by other reasons, though I donďż˝t need 2,53GHz for it :-). My 96' Chipset is fullfilling any Quest and Windows XP Sp2 fits perfectly to the hardware I mentioned. It fits even better than NTo4 (i used Too on it, NO AGP texturing, NO DX <3), though you need some MHz more, indeed. I would say a fast 300-400MHz CPU can do XP. A good chipset preconditioned.

Although I do not pay only to MS. Any honourable Software Developer..

Best Regards,

Daniel Mandic

Yep - I absolutely agree. Sometimes training the (l)users what to expect from an old PC is more trouble than it's worth. That's why in the company I worked for (owned) until recently, we'd decided not to sell second-hand PCs at all due to the high-expectations low-cost mentality.

We had our fingers burnt with this very early on in about 1994 when we gave our old 286 PC to a friend who was starting a small business. I cleaned up the PC, re-formatted the 20Mb hard drive, gave her our copy of WordStar (which we wouldn't be needing any more) and actually wrote a small db in Clipper so that she could keep track of her clients. All I charged her for was a small amount of extra hardware needed (think it needed a new keyboard or something) and she refused to pay. Why? Because, despite the fact that she was initially very happy, a friend had popped in, looked at the PC and told her that all PCs should be running Windows 3.1. Since this PC wasn't, then she dumped it back on our doorstep, complaining bitterly that we'd taken advantage of her lack of knowledge!!

I learnt then that the only way to avoid problems with most computer-illiterate people is to sell them new equipment.

/matt

The most popular computer of all time is the PC, also the most sold. Remember that for every one person bashing Windows (which is not the only OS it can use), there are probably 1,000's that are perfectly happy with it.

If you want to be picky, the Gameboy is the most popular computer of all time, as although it can't be programmed out of the box, it still "computes", and they

sold Waaaay more than the C64 in their various guises.

This counting your recent "bed-wetting" experience?

And the many posts about recovering a game you lost many years ago,
including the dream sequences you had that you thought was an attempt
by your subconscious to provide you with a program to recover the data?

Those were just in the last month or so...

Resist a chance to make a dig at windows as a proof that good does not equal popular or "most"?

Nope, can't resist for a second, what are you going to do about it?

I think most Commodore users like Atari 8 bits, and vice versa so no
insecurity there. Spectrum owners on the other hand...

Wrong. PC is a generic term, the hardware has substantially changed between each model. Of any particular model, with the same specs, the C64 is the highest selling computer ever. Not likely to change any time soon either. Guinness book of records also lists this.

Remember
> that for every one person bashing Windows (which is not the only OS it can
> use),

Agreed, except for that last bit. The BBC micro was a bit crap.

The VW is to cars what the ZX is to computers. Fortunately there was the
C64, a real computer with a real keyboard and real custom chips to make it
exciting.

The scope isn't limited since the hardware and compatibility changes
significantly between the PC models. It is an extra feather in the C64 cap
that it achieved the success that it did without changing the hardware (in
any real way) and over such a long period of time.

> Best selling computer of all time is unfortunately, the IBM PC and

Nobody takes people like you seriously. You are absolutely incapable
of looking at things objectively. You use any excuse to say "M$
sucks!". You automatically treat non-Linux users as inferiors. You
make ridiculous claims, such as "Firefox doesn't have serious
exploits". Because of the support of your back-slapping Linux pals,
you act like you are able to outclass the technical experience of a
large corporation full of top consultants, computer scientists and
researchers. You are essentially an arrogant fool.

Take a step back and stop applying binary logic to everything. Windows
has a lot of problems (as does Linux, as does Mac OS...), but it isn't
a joke. Far more talented people than you use it daily.

Linux is great, and has its place. Unfortunately, people like you
insist on bad advocacy and harm it a great deal. Save it for Slashdot,
because nobody else wants to hear it.
